[4293] GAM316 gene, herein designated GAM GENE, encodes a GAM316 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM316 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM316 precursor RNA is designated SEQ ID:293, and is provided

hereinbelow with reference to the sequence listing part.

[4294] GAM316 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM316 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4295] An enzyme complex designated DICER COMPLEX, dices the GAM316 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM316 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM316 RNA is designated SEQ ID:2887, and is provided hereinbelow with reference to the sequence listing part.

[4296] GAM316 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM316 target RNA, herein designated GAM TARGET RNA. GAM316 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[4297] GAM316 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM316 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM316 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM316 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM316 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4298] The complementary binding of GAM316 RNA, herein designated GAM RNA, to target binding sites on GAM316 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM316 target RNA, herein designated GAM TARGET RNA, into GAM316 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4299] It is appreciated that GAM316 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM316 target genes. The mRNA of each one of this plurality of GAM316 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM316 RNA, herein designated GAM RNA, and which when bound by GAM316 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM316 target proteins.

[4300] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM316 gene, herein designated GAM GENE, on one or more GAM316 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4301] It is yet further appreciated that specific functions, and accordingly utilities, of GAM316 correlate with, and may be deduced from, the identity of the target genes which GAM316 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4302] Nucleotide sequences of the GAM316 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM316 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM316 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM316 are further described hereinbelow with reference to Table 1.

[4303] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM316 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4304] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 317 (GAM317) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4305] GAM317 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM317 was detected is described hereinabove with reference to Figs. 2-8.

[4306] GAM317 gene, herein designated GAM GENE, and GAM317 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4307] GAM317 gene, herein designated GAM GENE, encodes a GAM317 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM317 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM317 precursor RNA is designated SEQ ID:294, and is provided hereinbelow with reference to the sequence listing part.

[4308] GAM317 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM317 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4309] An enzyme complex designated DICER COMPLEX, dices the GAM317 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM317 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM317 RNA is designated SEQ ID:2888, and is provided hereinbelow with reference to the sequence listing part.

[4310] GAM317 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM317 target RNA, herein designated

GAM TARGET RNA. GAM317 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4311] GAM317 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM317 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM317 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM317 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM317 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4312] The complementary binding of GAM317 RNA, herein designated GAM RNA, to target binding sites on GAM317 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM317 target RNA, herein designated GAM

TARGET RNA, into GAM317 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4313] It is appreciated that GAM317 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM317 target genes. The mRNA of each one of this plurality of GAM317 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM317 RNA, herein designated GAM RNA, and which when bound by GAM317 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM317 target proteins.

[4314] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM317 gene, herein designated GAM GENE, on one or more GAM317 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4315] It is yet further appreciated that specific functions, and accordingly utilities, of GAM317 correlate with, and may be deduced from, the identity of the target

genes which GAM317 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4316] Nucleotide sequences of the GAM317 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM317 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM317 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM317 are further described hereinbelow with reference to Table 1.

[4317] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM317 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4318] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 318 (GAM318) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4319] GAM318 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM318 was detected is described hereinabove with reference to Figs. 2-8.

[4320] GAM318 gene, herein designated GAM GENE, and GAM318 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[4321] GAM318 gene, herein designated GAM GENE, encodes a GAM318 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM318 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM318 precursor RNA is designated SEQ ID:295, and is provided hereinbelow with reference to the sequence listing part.

[4322] GAM318 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM318 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4323] An enzyme complex designated DICER COMPLEX, dices the GAM318 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM318 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM318 RNA is designated SEQ ID:2889, and is provided

hereinbelow with reference to the sequence listing part.

[4324] GAM318 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM318 target RNA, herein designated GAM TARGET RNA. GAM318 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4325] GAM318 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM318 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM318 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM318 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM318 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4326] The complementary binding of GAM318 RNA, herein designated GAM RNA, to target binding sites on GAM318 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM318 target RNA, herein designated GAM TARGET RNA, into GAM318 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4327] It is appreciated that GAM318 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM318 target genes. The mRNA of each one of this plurality of GAM318 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM318 RNA, herein designated GAM RNA, and which when bound by GAM318 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM318 target proteins.

[4328] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM318 gene, herein designated GAM GENE, on one or more GAM318 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4329] It is yet further appreciated that specific functions, and accordingly utilities, of GAM318 correlate with, and may be deduced from, the identity of the target genes which GAM318 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4330] Nucleotide sequences of the GAM318 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM318 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM318 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM318 are further described hereinbelow with reference to Table 1.

[4331] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM318 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4332] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 319 (GAM319) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4333] GAM319 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM319 was detected is

described hereinabove with reference to Figs. 2-8.

[4334] GAM319 gene, herein designated GAM GENE, and GAM319 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4335] GAM319 gene, herein designated GAM GENE, encodes a GAM319 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM319 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM319 precursor RNA is designated SEQ ID:296, and is provided hereinbelow with reference to the sequence listing part.

[4336] GAM319 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM319 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4337] An enzyme complex designated DICER COMPLEX, dices the GAM319 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM319 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM319 RNA is designated SEQ ID:2890, and is provided hereinbelow with reference to the sequence listing part.

[4338] GAM319 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM319 target RNA, herein designated GAM TARGET RNA. GAM319 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4339] GAM319 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM319 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM319 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM319 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM319 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4340] The complementary binding of GAM319 RNA, herein designated GAM RNA, to target binding sites on GAM319 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM319 target RNA, herein designated GAM TARGET RNA, into GAM319 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4341] It is appreciated that GAM319 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM319 target genes. The mRNA of each one of this plurality of GAM319 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM319 RNA, herein designated GAM RNA, and which when bound by GAM319 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM319 target proteins.

[4342] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM319 gene, herein designated GAM GENE, on one or more GAM319 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4343] It is yet further appreciated that specific functions, and accordingly utilities, of GAM319 correlate with, and may be deduced from, the identity of the target genes which GAM319 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4344] Nucleotide sequences of the GAM319 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM319 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM319 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM319 are further described hereinbelow with reference to Table 1.

[4345] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM319 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4346] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 320 (GAM320) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4347] GAM320 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM320 was detected is described hereinabove with reference to Figs. 2-8.

[4348] GAM320 gene, herein designated GAM GENE, and GAM320 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4349] GAM320 gene, herein designated GAM GENE, encodes a GAM320 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM320 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM320 precursor RNA is designated SEQ ID:297, and is provided hereinbelow with reference to the sequence listing part.

[4350] GAM320 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM320 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4351] An enzyme complex designated DICER COMPLEX, dices the GAM320 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM320 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM320 RNA is designated SEQ ID:2891, and is provided hereinbelow with reference to the sequence listing part.

[4352] GAM320 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM320 target RNA, herein designated GAM TARGET RNA. GAM320 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4353] GAM320 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM320 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM320 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM320 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM320 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4354] The complementary binding of GAM320 RNA, herein designated GAM RNA, to target binding sites on GAM320 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM320 target RNA, herein designated GAM TARGET RNA, into GAM320 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4355] It is appreciated that GAM320 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM320 target genes. The mRNA of each one of this plurality of GAM320 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM320 RNA, herein designated GAM RNA, and which when bound by GAM320 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM320 target proteins.

[4356] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM320 gene, herein designated GAM GENE, on one or more GAM320 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4357] It is yet further appreciated that specific functions, and accordingly utilities, of GAM320 correlate with, and may be deduced from, the identity of the target genes which GAM320 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4358] Nucleotide sequences of the GAM320 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM320 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM320 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM320 are further described hereinbelow with reference to Table 1.

[4359] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM320 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4360] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 321 (GAM321) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4361] GAM321 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM321 was detected is described hereinabove with reference to Figs. 2-8.

[4362] GAM321 gene, herein designated GAM GENE, and GAM321 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4363] GAM321 gene, herein designated GAM GENE, encodes a GAM321 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM321 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM321 precursor RNA is designated SEQ ID:298, and is provided hereinbelow with reference to the sequence listing part.

[4364] GAM321 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM321 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4365] An enzyme complex designated DICER COMPLEX, dices the GAM321 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM321 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM321 RNA is designated SEQ ID:2893, and is provided hereinbelow with reference to the sequence listing part.

[4366] GAM321 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM321 target RNA, herein designated GAM TARGET RNA. GAM321 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4367] GAM321 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM321 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM321 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM321 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM321 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4368] The complementary binding of GAM321 RNA, herein designated GAM RNA, to target binding sites on GAM321 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM321 target RNA, herein designated GAM TARGET RNA, into GAM321 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4369] It is appreciated that GAM321 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM321 target genes. The mRNA of each one of this plurality of GAM321 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM321 RNA, herein designated GAM RNA, and which when bound by GAM321 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM321 target proteins.

[4370] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM321 gene, herein designated GAM GENE, on one or more

GAM321 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4371] It is yet further appreciated that specific functions, and accordingly utilities, of GAM321 correlate with, and may be deduced from, the identity of the target genes which GAM321 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4372] Nucleotide sequences of the GAM321 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM321 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM321 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM321 are further described hereinbelow with reference to Table 1.

[4373] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM321 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4374] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 322 (GAM322) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4375] GAM322 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM322 was detected is described hereinabove with reference to Figs. 2-8.

[4376] GAM322 gene, herein designated GAM GENE, and GAM322 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4377] GAM322 gene, herein designated GAM GENE, encodes a GAM322 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM322 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM322 precursor RNA is designated SEQ ID:299, and is provided hereinbelow with reference to the sequence listing part.

[4378] GAM322 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM322 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4379] An enzyme complex designated DICER COMPLEX, dices the GAM322 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM322 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM322 RNA is designated SEQ ID:2892, and is provided hereinbelow with reference to the sequence listing part.

[4380] GAM322 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM322 target RNA, herein designated GAM TARGET RNA. GAM322 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4381] GAM322 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM322 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM322 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM322 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM322 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4382] The complementary binding of GAM322 RNA, herein designated GAM RNA, to target binding sites on GAM322 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM322 target RNA, herein designated GAM TARGET RNA, into GAM322 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4383] It is appreciated that GAM322 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM322 target genes. The mRNA of each one of this plurality of GAM322 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM322 RNA, herein designated GAM RNA, and which when bound by GAM322 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM322 target proteins.

[4384] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM322 gene, herein designated GAM GENE, on one or more GAM322 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4385] It is yet further appreciated that specific functions, and accordingly utilities, of GAM322 correlate with, and may be deduced from, the identity of the target genes which GAM322 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4386] Nucleotide sequences of the GAM322 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM322 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM322 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM322 are further described hereinbelow with reference to Table 1.

[4387] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM322 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4388] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 323 (GAM323) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4389] GAM323 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM323 was detected is described hereinabove with reference to Figs. 2-8.

[4390] GAM323 gene, herein designated GAM GENE, and GAM323 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4391] GAM323 gene, herein designated GAM GENE, encodes a GAM323 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM323 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM323 precursor RNA is designated SEQ ID:300, and is provided hereinbelow with reference to the sequence listing part.

[4392] GAM323 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM323 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4393] An enzyme complex designated DICER COMPLEX, dices the GAM323 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM323 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM323 RNA is designated SEQ ID:2894, and is provided hereinbelow with reference to the sequence listing part.

[4394] GAM323 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM323 target RNA, herein designated GAM TARGET RNA. GAM323 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4395] GAM323 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM323

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM323 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM323 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM323 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4396] The complementary binding of GAM323 RNA, herein designated GAM RNA, to target binding sites on GAM323 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM323 target RNA, herein designated GAM TARGET RNA, into GAM323 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4397] It is appreciated that GAM323 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM323 target genes. The mRNA of each one of this plurality of GAM323 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM323 RNA, herein designated GAM RNA, and which when bound by GAM323 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM323 target proteins.

[4398] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM323 gene, herein designated GAM GENE, on one or more GAM323 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4399] It is yet further appreciated that specific functions, and accordingly utilities, of GAM323 correlate with, and may be deduced from, the identity of the target genes which GAM323 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4400] Nucleotide sequences of the GAM323 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM323 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM323 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM323 are further described hereinbelow with

reference to Table 1.

[4401] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM323 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4402] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 324 (GAM324) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4403] GAM324 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM324 was detected is described hereinabove with reference to Figs. 2-8.

[4404] GAM324 gene, herein designated GAM GENE, and GAM324 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4405] GAM324 gene, herein designated GAM GENE, encodes a GAM324 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM324 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM324 precursor RNA is designated SEQ ID:301, and is provided

hereinbelow with reference to the sequence listing part.

[4406] GAM324 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM324 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4407] An enzyme complex designated DICER COMPLEX, dices the GAM324 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM324 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM324 RNA is designated SEQ ID:2895, and is provided hereinbelow with reference to the sequence listing part.

[4408] GAM324 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM324 target RNA, herein designated GAM TARGET RNA. GAM324 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[4409] GAM324 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM324 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM324 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM324 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM324 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4410] The complementary binding of GAM324 RNA, herein designated GAM RNA, to target binding sites on GAM324 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM324 target RNA, herein designated GAM TARGET RNA, into GAM324 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4411] It is appreciated that GAM324 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM324 target genes. The mRNA of each one of this plurality of GAM324 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM324 RNA, herein designated GAM RNA, and which when bound by GAM324 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM324 target proteins.

[4412] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM324 gene, herein designated GAM GENE, on one or more GAM324 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4413] It is yet further appreciated that specific functions, and accordingly utilities, of GAM324 correlate with, and may be deduced from, the identity of the target genes which GAM324 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4414] Nucleotide sequences of the GAM324 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM324 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM324 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM324 are further described hereinbelow with reference to Table 1.

[4415] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM324 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4416] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 325 (GAM325) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4417] GAM325 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM325 was detected is described hereinabove with reference to Figs. 2-8.

[4418] GAM325 gene, herein designated GAM GENE, and GAM325 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4419] GAM325 gene, herein designated GAM GENE, encodes a GAM325 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM325 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM325 precursor RNA is designated SEQ ID:302, and is provided hereinbelow with reference to the sequence listing part.

[4420] GAM325 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM325 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4421] An enzyme complex designated DICER COMPLEX, dices the GAM325 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM325 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM325 RNA is designated SEQ ID:2896, and is provided hereinbelow with reference to the sequence listing part.

[4422] GAM325 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM325 target RNA, herein designated

GAM TARGET RNA. GAM325 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4423] GAM325 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM325 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM325 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM325 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM325 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4424] The complementary binding of GAM325 RNA, herein designated GAM RNA, to target binding sites on GAM325 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM325 target RNA, herein designated GAM

TARGET RNA, into GAM325 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4425] It is appreciated that GAM325 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM325 target genes. The mRNA of each one of this plurality of GAM325 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM325 RNA, herein designated GAM RNA, and which when bound by GAM325 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM325 target proteins.

[4426] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM325 gene, herein designated GAM GENE, on one or more GAM325 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4427] It is yet further appreciated that specific functions, and accordingly utilities, of GAM325 correlate with, and may be deduced from, the identity of the target

genes which GAM325 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4428] Nucleotide sequences of the GAM325 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM325 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM325 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM325 are further described hereinbelow with reference to Table 1.

[4429] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM325 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4430] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 326 (GAM326) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4431] GAM326 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM326 was detected is described hereinabove with reference to Figs. 2-8.

[4432] GAM326 gene, herein designated GAM GENE, and GAM326 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[4433] GAM326 gene, herein designated GAM GENE, encodes a GAM326 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM326 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM326 precursor RNA is designated SEQ ID:303, and is provided hereinbelow with reference to the sequence listing part.

[4434] GAM326 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM326 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4435] An enzyme complex designated DICER COMPLEX, dices the GAM326 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM326 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM326 RNA is designated SEQ ID:2897, and is provided

hereinbelow with reference to the sequence listing part.

[4436] GAM326 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM326 target RNA, herein designated GAM TARGET RNA. GAM326 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4437] GAM326 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM326 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM326 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM326 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM326 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4438] The complementary binding of GAM326 RNA, herein designated GAM RNA, to target binding sites on GAM326 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM326 target RNA, herein designated GAM TARGET RNA, into GAM326 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4439] It is appreciated that GAM326 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM326 target genes. The mRNA of each one of this plurality of GAM326 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM326 RNA, herein designated GAM RNA, and which when bound by GAM326 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM326 target proteins.

[4440] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM326 gene, herein designated GAM GENE, on one or more GAM326 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4441] It is yet further appreciated that specific functions, and accordingly utilities, of GAM326 correlate with, and may be deduced from, the identity of the target genes which GAM326 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4442] Nucleotide sequences of the GAM326 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM326 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM326 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM326 are further described hereinbelow with reference to Table 1.

[4443] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM326 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4444] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 327 (GAM327) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4445] GAM327 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM327 was detected is

described hereinabove with reference to Figs. 2-8.

[4446] GAM327 gene, herein designated GAM GENE, and GAM327 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4447] GAM327 gene, herein designated GAM GENE, encodes a GAM327 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM327 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM327 precursor RNA is designated SEQ ID:304, and is provided hereinbelow with reference to the sequence listing part.

[4448] GAM327 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM327 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4449] An enzyme complex designated DICER COMPLEX, dices the GAM327 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM327 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM327 RNA is designated SEQ ID:2898, and is provided hereinbelow with reference to the sequence listing part.

[4450] GAM327 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM327 target RNA, herein designated GAM TARGET RNA. GAM327 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4451] GAM327 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM327 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM327 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM327 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM327 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4452] The complementary binding of GAM327 RNA, herein designated GAM RNA, to target binding sites on GAM327 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM327 target RNA, herein designated GAM TARGET RNA, into GAM327 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4453] It is appreciated that GAM327 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM327 target genes. The mRNA of each one of this plurality of GAM327 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM327 RNA, herein designated GAM RNA, and which when bound by GAM327 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM327 target proteins.

[4454] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM327 gene, herein designated GAM GENE, on one or more GAM327 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4455] It is yet further appreciated that specific functions, and accordingly utilities, of GAM327 correlate with, and may be deduced from, the identity of the target genes which GAM327 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4456] Nucleotide sequences of the GAM327 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM327 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM327 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM327 are further described hereinbelow with reference to Table 1.

[4457] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM327 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4458] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 328 (GAM328) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4459] GAM328 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM328 was detected is described hereinabove with reference to Figs. 2-8.

[4460] GAM328 gene, herein designated GAM GENE, and GAM328 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4461] GAM328 gene, herein designated GAM GENE, encodes a GAM328 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM328 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM328 precursor RNA is designated SEQ ID:305, and is provided hereinbelow with reference to the sequence listing part.

[4462] GAM328 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM328 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4463] An enzyme complex designated DICER COMPLEX, dices the GAM328 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM328 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM328 RNA is designated SEQ ID:2899, and is provided hereinbelow with reference to the sequence listing part.

[4464] GAM328 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM328 target RNA, herein designated GAM TARGET RNA. GAM328 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4465] GAM328 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM328 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM328 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM328 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM328 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4466] The complementary binding of GAM328 RNA, herein designated GAM RNA, to target binding sites on GAM328 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM328 target RNA, herein designated GAM TARGET RNA, into GAM328 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4467] It is appreciated that GAM328 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM328 target genes. The mRNA of each one of this plurality of GAM328 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM328 RNA, herein designated GAM RNA, and which when bound by GAM328 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM328 target proteins.

[4468] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM328 gene, herein designated GAM GENE, on one or more GAM328 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4469] It is yet further appreciated that specific functions, and accordingly utilities, of GAM328 correlate with, and may be deduced from, the identity of the target genes which GAM328 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4470] Nucleotide sequences of the GAM328 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM328 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM328 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM328 are further described hereinbelow with reference to Table 1.

[4471] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM328 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4472] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 329 (GAM329) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4473] GAM329 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM329 was detected is described hereinabove with reference to Figs. 2-8.

[4474] GAM329 gene, herein designated GAM GENE, and GAM329 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4475] GAM329 gene, herein designated GAM GENE, encodes a GAM329 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM329 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM329 precursor RNA is designated SEQ ID:306, and is provided hereinbelow with reference to the sequence listing part.

[4476] GAM329 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM329 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4477] An enzyme complex designated DICER COMPLEX, dices the GAM329 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM329 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM329 RNA is designated SEQ ID:2900, and is provided hereinbelow with reference to the sequence listing part.

[4478] GAM329 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM329 target RNA, herein designated GAM TARGET RNA. GAM329 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4479] GAM329 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM329 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM329 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM329 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM329 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4480] The complementary binding of GAM329 RNA, herein designated GAM RNA, to target binding sites on GAM329 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM329 target RNA, herein designated GAM TARGET RNA, into GAM329 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4481] It is appreciated that GAM329 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM329 target genes. The mRNA of each one of this plurality of GAM329 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM329 RNA, herein designated GAM RNA, and which when bound by GAM329 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM329 target proteins.

[4482] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM329 gene, herein designated GAM GENE, on one or more

GAM329 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4483] It is yet further appreciated that specific functions, and accordingly utilities, of GAM329 correlate with, and may be deduced from, the identity of the target genes which GAM329 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4484] Nucleotide sequences of the GAM329 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM329 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM329 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM329 are further described hereinbelow with reference to Table 1.

[4485] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM329 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4486] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 330 (GAM330) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4487] GAM330 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM330 was detected is described hereinabove with reference to Figs. 2-8.

[4488] GAM330 gene, herein designated GAM GENE, and GAM330 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4489] GAM330 gene, herein designated GAM GENE, encodes a GAM330 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM330 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM330 precursor RNA is designated SEQ ID:307, and is provided hereinbelow with reference to the sequence listing part.

[4490] GAM330 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4491] An enzyme complex designated DICER COMPLEX, dices the GAM330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM330 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM330 RNA is designated SEQ ID:2901, and is provided hereinbelow with reference to the sequence listing part.

[4492] GAM330 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM330 target RNA, herein designated GAM TARGET RNA. GAM330 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4493] GAM330 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM330 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM330 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM330 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM330 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4494] The complementary binding of GAM330 RNA, herein designated GAM RNA, to target binding sites on GAM330 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM330 target RNA, herein designated GAM TARGET RNA, into GAM330 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4495] It is appreciated that GAM330 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM330 target genes. The mRNA of each one of this plurality of GAM330 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM330 RNA, herein designated GAM RNA, and which when bound by GAM330 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM330 target proteins.

[4496] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM330 gene, herein designated GAM GENE, on one or more GAM330 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4497] It is yet further appreciated that specific functions, and accordingly utilities, of GAM330 correlate with, and may be deduced from, the identity of the target genes which GAM330 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4498] Nucleotide sequences of the GAM330 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM330 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM330 are further described hereinbelow with reference to Table 1.

[4499] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM330 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4500] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 331 (GAM331) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4501] GAM331 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM331 was detected is described hereinabove with reference to Figs. 2-8.

[4502] GAM331 gene, herein designated GAM GENE, and GAM331 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4503] GAM331 gene, herein designated GAM GENE, encodes a GAM331 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM331 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM331 precursor RNA is designated SEQ ID:308, and is provided hereinbelow with reference to the sequence listing part.

[4504] GAM331 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM331 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4505] An enzyme complex designated DICER COMPLEX, dices the GAM331 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM331 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM331 RNA is designated SEQ ID:2902, and is provided hereinbelow with reference to the sequence listing part.

[4506] GAM331 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM331 target RNA, herein designated GAM TARGET RNA. GAM331 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4507] GAM331 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM331

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM331 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM331 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM331 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4508] The complementary binding of GAM331 RNA, herein designated GAM RNA, to target binding sites on GAM331 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM331 target RNA, herein designated GAM TARGET RNA, into GAM331 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4509] It is appreciated that GAM331 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM331 target genes. The mRNA of each one of this plurality of GAM331 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM331 RNA, herein designated GAM RNA, and which when bound by GAM331 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM331 target proteins.

[4510] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM331 gene, herein designated GAM GENE, on one or more GAM331 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4511] It is yet further appreciated that specific functions, and accordingly utilities, of GAM331 correlate with, and may be deduced from, the identity of the target genes which GAM331 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4512] Nucleotide sequences of the GAM331 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM331 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM331 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM331 are further described hereinbelow with

reference to Table 1.

[4513] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM331 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4514] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 332 (GAM332) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4515] GAM332 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM332 was detected is described hereinabove with reference to Figs. 2-8.

[4516] GAM332 gene, herein designated GAM GENE, and GAM332 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4517] GAM332 gene, herein designated GAM GENE, encodes a GAM332 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM332 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM332 precursor RNA is designated SEQ ID:309, and is provided

hereinbelow with reference to the sequence listing part.

[4518] GAM332 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM332 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4519] An enzyme complex designated DICER COMPLEX, dices the GAM332 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM332 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM332 RNA is designated SEQ ID:2903, and is provided hereinbelow with reference to the sequence listing part.

[4520] GAM332 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM332 target RNA, herein designated GAM TARGET RNA. GAM332 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[4521] GAM332 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM332 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM332 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM332 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM332 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4522] The complementary binding of GAM332 RNA, herein designated GAM RNA, to target binding sites on GAM332 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM332 target RNA, herein designated GAM TARGET RNA, into GAM332 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4523] It is appreciated that GAM332 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM332 target genes. The mRNA of each one of this plurality of GAM332 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM332 RNA, herein designated GAM RNA, and which when bound by GAM332 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM332 target proteins.

[4524] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM332 gene, herein designated GAM GENE, on one or more GAM332 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4525] It is yet further appreciated that specific functions, and accordingly utilities, of GAM332 correlate with, and may be deduced from, the identity of the target genes which GAM332 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4526] Nucleotide sequences of the GAM332 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM332 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM332 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM332 are further described hereinbelow with reference to Table 1.

[4527] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM332 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4528] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 333 (GAM333) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4529] GAM333 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM333 was detected is described hereinabove with reference to Figs. 2-8.

[4530] GAM333 gene, herein designated GAM GENE, and GAM333 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4531] GAM333 gene, herein designated GAM GENE, encodes a GAM333 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM333 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM333 precursor RNA is designated SEQ ID:310, and is provided hereinbelow with reference to the sequence listing part.

[4532] GAM333 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM333 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4533] An enzyme complex designated DICER COMPLEX, dices the GAM333 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM333 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM333 RNA is designated SEQ ID:2904, and is provided hereinbelow with reference to the sequence listing part.

[4534] GAM333 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM333 target RNA, herein designated

GAM TARGET RNA. GAM333 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4535] GAM333 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM333 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM333 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM333 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM333 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4536] The complementary binding of GAM333 RNA, herein designated GAM RNA, to target binding sites on GAM333 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM333 target RNA, herein designated GAM

TARGET RNA, into GAM333 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4537] It is appreciated that GAM333 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM333 target genes. The mRNA of each one of this plurality of GAM333 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM333 RNA, herein designated GAM RNA, and which when bound by GAM333 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM333 target proteins.

[4538] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM333 gene, herein designated GAM GENE, on one or more GAM333 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4539] It is yet further appreciated that specific functions, and accordingly utilities, of GAM333 correlate with, and may be deduced from, the identity of the target

genes which GAM333 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4540] Nucleotide sequences of the GAM333 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM333 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM333 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM333 are further described hereinbelow with reference to Table 1.

[4541] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM333 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4542] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 334 (GAM334) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4543] GAM334 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM334 was detected is described hereinabove with reference to Figs. 2-8.

[4544] GAM334 gene, herein designated GAM GENE, and GAM334 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[4545] GAM334 gene, herein designated GAM GENE, encodes a GAM334 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM334 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM334 precursor RNA is designated SEQ ID:311, and is provided hereinbelow with reference to the sequence listing part.

[4546] GAM334 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM334 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4547] An enzyme complex designated DICER COMPLEX, dices the GAM334 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM334 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM334 RNA is designated SEQ ID:2905, and is provided

hereinbelow with reference to the sequence listing part.

[4548] GAM334 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM334 target RNA, herein designated GAM TARGET RNA. GAM334 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4549] GAM334 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM334 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM334 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM334 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM334 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4550] The complementary binding of GAM334 RNA, herein designated GAM RNA, to target binding sites on GAM334 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM334 target RNA, herein designated GAM TARGET RNA, into GAM334 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4551] It is appreciated that GAM334 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM334 target genes. The mRNA of each one of this plurality of GAM334 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM334 RNA, herein designated GAM RNA, and which when bound by GAM334 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM334 target proteins.

[4552] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM334 gene, herein designated GAM GENE, on one or more GAM334 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4553] It is yet further appreciated that specific functions, and accordingly utilities, of GAM334 correlate with, and may be deduced from, the identity of the target genes which GAM334 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4554] Nucleotide sequences of the GAM334 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM334 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM334 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM334 are further described hereinbelow with reference to Table 1.

[4555] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM334 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4556] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 335 (GAM335) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4557] GAM335 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM335 was detected is

described hereinabove with reference to Figs. 2-8.

[4558] GAM335 gene, herein designated GAM GENE, and GAM335 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4559] GAM335 gene, herein designated GAM GENE, encodes a GAM335 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM335 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM335 precursor RNA is designated SEQ ID:312, and is provided hereinbelow with reference to the sequence listing part.

[4560] GAM335 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM335 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4561] An enzyme complex designated DICER COMPLEX, dices the GAM335 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM335 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM335 RNA is designated SEQ ID:2906, and is provided hereinbelow with reference to the sequence listing part.

[4562] GAM335 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM335 target RNA, herein designated GAM TARGET RNA. GAM335 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4563] GAM335 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM335 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM335 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM335 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM335 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4564] The complementary binding of GAM335 RNA, herein designated GAM RNA, to target binding sites on GAM335 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM335 target RNA, herein designated GAM TARGET RNA, into GAM335 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4565] It is appreciated that GAM335 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM335 target genes. The mRNA of each one of this plurality of GAM335 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM335 RNA, herein designated GAM RNA, and which when bound by GAM335 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM335 target proteins.

[4566] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM335 gene, herein designated GAM GENE, on one or more GAM335 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4567] It is yet further appreciated that specific functions, and accordingly utilities, of GAM335 correlate with, and may be deduced from, the identity of the target genes which GAM335 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4568] Nucleotide sequences of the GAM335 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM335 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM335 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM335 are further described hereinbelow with reference to Table 1.

[4569] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM335 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4570] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 336 (GAM336) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4571] GAM336 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM336 was detected is described hereinabove with reference to Figs. 2-8.

[4572] GAM336 gene, herein designated GAM GENE, and GAM336 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4573] GAM336 gene, herein designated GAM GENE, encodes a GAM336 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM336 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM336 precursor RNA is designated SEQ ID:313, and is provided hereinbelow with reference to the sequence listing part.

[4574] GAM336 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM336 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4575] An enzyme complex designated DICER COMPLEX, dices the GAM336 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM336 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM336 RNA is designated SEQ ID:2907, and is provided hereinbelow with reference to the sequence listing part.

[4576] GAM336 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM336 target RNA, herein designated GAM TARGET RNA. GAM336 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4577] GAM336 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM336 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM336 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM336 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM336 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4578] The complementary binding of GAM336 RNA, herein designated GAM RNA, to target binding sites on GAM336 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM336 target RNA, herein designated GAM TARGET RNA, into GAM336 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4579] It is appreciated that GAM336 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM336 target genes. The mRNA of each one of this plurality of GAM336 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM336 RNA, herein designated GAM RNA, and which when bound by GAM336 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM336 target proteins.

[4580] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM336 gene, herein designated GAM GENE, on one or more GAM336 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4581] It is yet further appreciated that specific functions, and accordingly utilities, of GAM336 correlate with, and may be deduced from, the identity of the target genes which GAM336 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4582] Nucleotide sequences of the GAM336 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM336 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM336 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM336 are further described hereinbelow with reference to Table 1.

[4583] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM336 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4584] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 337 (GAM337) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4585] GAM337 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM337 was detected is described hereinabove with reference to Figs. 2-8.

[4586] GAM337 gene, herein designated GAM GENE, and GAM337 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4587] GAM337 gene, herein designated GAM GENE, encodes a GAM337 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM337 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM337 precursor RNA is designated SEQ ID:314, and is provided hereinbelow with reference to the sequence listing part.

[4588] GAM337 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM337 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4589] An enzyme complex designated DICER COMPLEX, dices the GAM337 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM337 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM337 RNA is designated SEQ ID:2908, and is provided hereinbelow with reference to the sequence listing part.

[4590] GAM337 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM337 target RNA, herein designated GAM TARGET RNA. GAM337 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4591] GAM337 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM337 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM337 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM337 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM337 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4592] The complementary binding of GAM337 RNA, herein designated GAM RNA, to target binding sites on GAM337 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM337 target RNA, herein designated GAM TARGET RNA, into GAM337 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4593] It is appreciated that GAM337 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM337 target genes. The mRNA of each one of this plurality of GAM337 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM337 RNA, herein designated GAM RNA, and which when bound by GAM337 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM337 target proteins.

[4594] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM337 gene, herein designated GAM GENE, on one or more

GAM337 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4595] It is yet further appreciated that specific functions, and accordingly utilities, of GAM337 correlate with, and may be deduced from, the identity of the target genes which GAM337 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4596] Nucleotide sequences of the GAM337 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM337 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM337 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM337 are further described hereinbelow with reference to Table 1.

[4597] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM337 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4598] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 338 (GAM338) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4599] GAM338 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM338 was detected is described hereinabove with reference to Figs. 2-8.

[4600] GAM338 gene, herein designated GAM GENE, and GAM338 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4601] GAM338 gene, herein designated GAM GENE, encodes a GAM338 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM338 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM338 precursor RNA is designated SEQ ID:315, and is provided hereinbelow with reference to the sequence listing part.

[4602] GAM338 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM338 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4603] An enzyme complex designated DICER COMPLEX, dices the GAM338 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM338 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM338 RNA is designated SEQ ID:2912, and is provided hereinbelow with reference to the sequence listing part.

[4604] GAM338 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM338 target RNA, herein designated GAM TARGET RNA. GAM338 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4605] GAM338 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM338 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM338 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM338 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM338 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4606] The complementary binding of GAM338 RNA, herein designated GAM RNA, to target binding sites on GAM338 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM338 target RNA, herein designated GAM TARGET RNA, into GAM338 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4607] It is appreciated that GAM338 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM338 target genes. The mRNA of each one of this plurality of GAM338 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM338 RNA, herein designated GAM RNA, and which when bound by GAM338 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM338 target proteins.

[4608] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM338 gene, herein designated GAM GENE, on one or more GAM338 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4609] It is yet further appreciated that specific functions, and accordingly utilities, of GAM338 correlate with, and may be deduced from, the identity of the target genes which GAM338 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4610] Nucleotide sequences of the GAM338 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM338 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM338 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM338 are further described hereinbelow with reference to Table 1.

[4611] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM338 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4612] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 339 (GAM339) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4613] GAM339 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM339 was detected is described hereinabove with reference to Figs. 2-8.

[4614] GAM339 gene, herein designated GAM GENE, and GAM339 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4615] GAM339 gene, herein designated GAM GENE, encodes a GAM339 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM339 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM339 precursor RNA is designated SEQ ID:316, and is provided hereinbelow with reference to the sequence listing part.

[4616] GAM339 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM339 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4617] An enzyme complex designated DICER COMPLEX, dices the GAM339 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM339 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM339 RNA is designated SEQ ID:2913, and is provided hereinbelow with reference to the sequence listing part.

[4618] GAM339 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM339 target RNA, herein designated GAM TARGET RNA. GAM339 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4619] GAM339 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM339

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM339 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM339 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM339 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4620] The complementary binding of GAM339 RNA, herein designated GAM RNA, to target binding sites on GAM339 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM339 target RNA, herein designated GAM TARGET RNA, into GAM339 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4621] It is appreciated that GAM339 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM339 target genes. The mRNA of each one of this plurality of GAM339 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM339 RNA, herein designated GAM RNA, and which when bound by GAM339 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM339 target proteins.

[4622] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM339 gene, herein designated GAM GENE, on one or more GAM339 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4623] It is yet further appreciated that specific functions, and accordingly utilities, of GAM339 correlate with, and may be deduced from, the identity of the target genes which GAM339 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4624] Nucleotide sequences of the GAM339 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM339 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM339 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM339 are further described hereinbelow with

reference to Table 1.

[4625] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM339 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4626] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 340 (GAM340) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4627] GAM340 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM340 was detected is described hereinabove with reference to Figs. 2-8.

[4628] GAM340 gene, herein designated GAM GENE, and GAM340 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4629] GAM340 gene, herein designated GAM GENE, encodes a GAM340 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM340 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM340 precursor RNA is designated SEQ ID:317, and is provided

hereinbelow with reference to the sequence listing part.

[4630] GAM340 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM340 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4631] An enzyme complex designated DICER COMPLEX, dices the GAM340 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM340 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM340 RNA is designated SEQ ID:2914, and is provided hereinbelow with reference to the sequence listing part.

[4632] GAM340 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM340 target RNA, herein designated GAM TARGET RNA. GAM340 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[4633] GAM340 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM340 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM340 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM340 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM340 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4634] The complementary binding of GAM340 RNA, herein designated GAM RNA, to target binding sites on GAM340 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM340 target RNA, herein designated GAM TARGET RNA, into GAM340 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4635] It is appreciated that GAM340 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM340 target genes. The mRNA of each one of this plurality of GAM340 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM340 RNA, herein designated GAM RNA, and which when bound by GAM340 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM340 target proteins.

[4636] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM340 gene, herein designated GAM GENE, on one or more GAM340 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4637] It is yet further appreciated that specific functions, and accordingly utilities, of GAM340 correlate with, and may be deduced from, the identity of the target genes which GAM340 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4638] Nucleotide sequences of the GAM340 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM340 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM340 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM340 are further described hereinbelow with reference to Table 1.

[4639] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM340 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4640] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 341 (GAM341) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4641] GAM341 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM341 was detected is described hereinabove with reference to Figs. 2-8.

[4642] GAM341 gene, herein designated GAM GENE, and GAM341 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4643] GAM341 gene, herein designated GAM GENE, encodes a GAM341 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM341 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM341 precursor RNA is designated SEQ ID:318, and is provided hereinbelow with reference to the sequence listing part.

[4644] GAM341 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM341 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4645] An enzyme complex designated DICER COMPLEX, dices the GAM341 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM341 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM341 RNA is designated SEQ ID:2915, and is provided hereinbelow with reference to the sequence listing part.

[4646] GAM341 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM341 target RNA, herein designated

GAM TARGET RNA. GAM341 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4647] GAM341 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM341 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM341 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM341 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM341 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4648] The complementary binding of GAM341 RNA, herein designated GAM RNA, to target binding sites on GAM341 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM341 target RNA, herein designated GAM

TARGET RNA, into GAM341 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4649] It is appreciated that GAM341 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM341 target genes. The mRNA of each one of this plurality of GAM341 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM341 RNA, herein designated GAM RNA, and which when bound by GAM341 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM341 target proteins.

[4650] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM341 gene, herein designated GAM GENE, on one or more GAM341 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4651] It is yet further appreciated that specific functions, and accordingly utilities, of GAM341 correlate with, and may be deduced from, the identity of the target

genes which GAM341 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4652] Nucleotide sequences of the GAM341 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM341 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM341 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM341 are further described hereinbelow with reference to Table 1.

[4653] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM341 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4654] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 342 (GAM342) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4655] GAM342 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM342 was detected is described hereinabove with reference to Figs. 2-8.

[4656] GAM342 gene, herein designated GAM GENE, and GAM342 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[4657] GAM342 gene, herein designated GAM GENE, encodes a GAM342 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM342 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM342 precursor RNA is designated SEQ ID:319, and is provided hereinbelow with reference to the sequence listing part.

[4658] GAM342 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM342 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4659] An enzyme complex designated DICER COMPLEX, dices the GAM342 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM342 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM342 RNA is designated SEQ ID:2916, and is provided

hereinbelow with reference to the sequence listing part.

[4660] GAM342 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM342 target RNA, herein designated GAM TARGET RNA. GAM342 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4661] GAM342 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM342 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM342 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM342 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM342 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4662] The complementary binding of GAM342 RNA, herein designated GAM RNA, to target binding sites on GAM342 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM342 target RNA, herein designated GAM TARGET RNA, into GAM342 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4663] It is appreciated that GAM342 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM342 target genes. The mRNA of each one of this plurality of GAM342 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM342 RNA, herein designated GAM RNA, and which when bound by GAM342 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM342 target proteins.

[4664] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM342 gene, herein designated GAM GENE, on one or more GAM342 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4665] It is yet further appreciated that specific functions, and accordingly utilities, of GAM342 correlate with, and may be deduced from, the identity of the target genes which GAM342 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4666] Nucleotide sequences of the GAM342 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM342 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM342 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM342 are further described hereinbelow with reference to Table 1.

[4667] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM342 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4668] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 343 (GAM343) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4669] GAM343 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM343 was detected is

described hereinabove with reference to Figs. 2-8.

[4670] GAM343 gene, herein designated GAM GENE, and GAM343 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4671] GAM343 gene, herein designated GAM GENE, encodes a GAM343 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM343 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM343 precursor RNA is designated SEQ ID:320, and is provided hereinbelow with reference to the sequence listing part.

[4672] GAM343 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM343 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4673] An enzyme complex designated DICER COMPLEX, dices the GAM343 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM343 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM343 RNA is designated SEQ ID:2917, and is provided hereinbelow with reference to the sequence listing part.

[4674] GAM343 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM343 target RNA, herein designated GAM TARGET RNA. GAM343 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4675] GAM343 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM343 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM343 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM343 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM343 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4676] The complementary binding of GAM343 RNA, herein designated GAM RNA, to target binding sites on GAM343 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM343 target RNA, herein designated GAM TARGET RNA, into GAM343 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4677] It is appreciated that GAM343 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM343 target genes. The mRNA of each one of this plurality of GAM343 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM343 RNA, herein designated GAM RNA, and which when bound by GAM343 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM343 target proteins.

[4678] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM343 gene, herein designated GAM GENE, on one or more GAM343 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4679] It is yet further appreciated that specific functions, and accordingly utilities, of GAM343 correlate with, and may be deduced from, the identity of the target genes which GAM343 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4680] Nucleotide sequences of the GAM343 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM343 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM343 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM343 are further described hereinbelow with reference to Table 1.

[4681] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM343 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4682] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 344 (GAM344) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4683] GAM344 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM344 was detected is described hereinabove with reference to Figs. 2-8.

[4684] GAM344 gene, herein designated GAM GENE, and GAM344 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4685] GAM344 gene, herein designated GAM GENE, encodes a GAM344 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM344 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM344 precursor RNA is designated SEQ ID:321, and is provided hereinbelow with reference to the sequence listing part.

[4686] GAM344 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM344 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4687] An enzyme complex designated DICER COMPLEX, dices the GAM344 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM344 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM344 RNA is designated SEQ ID:2918, and is provided hereinbelow with reference to the sequence listing part.

[4688] GAM344 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM344 target RNA, herein designated GAM TARGET RNA. GAM344 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4689] GAM344 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM344 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM344 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM344 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM344 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4690] The complementary binding of GAM344 RNA, herein designated GAM RNA, to target binding sites on GAM344 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM344 target RNA, herein designated GAM TARGET RNA, into GAM344 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4691] It is appreciated that GAM344 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM344 target genes. The mRNA of each one of this plurality of GAM344 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM344 RNA, herein designated GAM RNA, and which when bound by GAM344 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM344 target proteins.

[4692] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM344 gene, herein designated GAM GENE, on one or more GAM344 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4693] It is yet further appreciated that specific functions, and accordingly utilities, of GAM344 correlate with, and may be deduced from, the identity of the target genes which GAM344 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4694] Nucleotide sequences of the GAM344 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM344 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM344 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM344 are further described hereinbelow with reference to Table 1.

[4695] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM344 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4696] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 345 (GAM345) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4697] GAM345 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM345 was detected is described hereinabove with reference to Figs. 2-8.

[4698] GAM345 gene, herein designated GAM GENE, and GAM345 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4699] GAM345 gene, herein designated GAM GENE, encodes a GAM345 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM345 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM345 precursor RNA is designated SEQ ID:322, and is provided hereinbelow with reference to the sequence listing part.

[4700] GAM345 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM345 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4701] An enzyme complex designated DICER COMPLEX, dices the GAM345 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM345 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM345 RNA is designated SEQ ID:2919, and is provided hereinbelow with reference to the sequence listing part.

[4702] GAM345 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM345 target RNA, herein designated GAM TARGET RNA. GAM345 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4703] GAM345 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM345 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM345 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM345 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM345 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4704] The complementary binding of GAM345 RNA, herein designated GAM RNA, to target binding sites on GAM345 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM345 target RNA, herein designated GAM TARGET RNA, into GAM345 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4705] It is appreciated that GAM345 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM345 target genes. The mRNA of each one of this plurality of GAM345 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM345 RNA, herein designated GAM RNA, and which when bound by GAM345 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM345 target proteins.

[4706] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM345 gene, herein designated GAM GENE, on one or more

GAM345 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4707] It is yet further appreciated that specific functions, and accordingly utilities, of GAM345 correlate with, and may be deduced from, the identity of the target genes which GAM345 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4708] Nucleotide sequences of the GAM345 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM345 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM345 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM345 are further described hereinbelow with reference to Table 1.

[4709] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM345 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4710] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 346 (GAM346) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4711] GAM346 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM346 was detected is described hereinabove with reference to Figs. 2-8.

[4712] GAM346 gene, herein designated GAM GENE, and GAM346 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4713] GAM346 gene, herein designated GAM GENE, encodes a GAM346 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM346 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM346 precursor RNA is designated SEQ ID:323, and is provided hereinbelow with reference to the sequence listing part.

[4714] GAM346 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM346 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4715] An enzyme complex designated DICER COMPLEX, dices the GAM346 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM346 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM346 RNA is designated SEQ ID:2920, and is provided hereinbelow with reference to the sequence listing part.

[4716] GAM346 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM346 target RNA, herein designated GAM TARGET RNA. GAM346 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4717] GAM346 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM346 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM346 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM346 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM346 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4718] The complementary binding of GAM346 RNA, herein designated GAM RNA, to target binding sites on GAM346 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM346 target RNA, herein designated GAM TARGET RNA, into GAM346 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4719] It is appreciated that GAM346 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM346 target genes. The mRNA of each one of this plurality of GAM346 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM346 RNA, herein designated GAM RNA, and which when bound by GAM346 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM346 target proteins.

[4720] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM346 gene, herein designated GAM GENE, on one or more GAM346 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4721] It is yet further appreciated that specific functions, and accordingly utilities, of GAM346 correlate with, and may be deduced from, the identity of the target genes which GAM346 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4722] Nucleotide sequences of the GAM346 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM346 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM346 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM346 are further described hereinbelow with reference to Table 1.

[4723] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM346 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4724] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 347 (GAM347) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4725] GAM347 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM347 was detected is described hereinabove with reference to Figs. 2-8.

[4726] GAM347 gene, herein designated GAM GENE, and GAM347 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4727] GAM347 gene, herein designated GAM GENE, encodes a GAM347 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM347 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM347 precursor RNA is designated SEQ ID:324, and is provided hereinbelow with reference to the sequence listing part.

[4728] GAM347 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM347 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4729] An enzyme complex designated DICER COMPLEX, dices the GAM347 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM347 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM347 RNA is designated SEQ ID:2921, and is provided hereinbelow with reference to the sequence listing part.

[4730] GAM347 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM347 target RNA, herein designated GAM TARGET RNA. GAM347 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4731] GAM347 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM347

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM347 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM347 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM347 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4732] The complementary binding of GAM347 RNA, herein designated GAM RNA, to target binding sites on GAM347 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM347 target RNA, herein designated GAM TARGET RNA, into GAM347 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4733] It is appreciated that GAM347 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM347 target genes. The mRNA of each one of this plurality of GAM347 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM347 RNA, herein designated GAM RNA, and which when bound by GAM347 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM347 target proteins.

[4734] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM347 gene, herein designated GAM GENE, on one or more GAM347 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4735] It is yet further appreciated that specific functions, and accordingly utilities, of GAM347 correlate with, and may be deduced from, the identity of the target genes which GAM347 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4736] Nucleotide sequences of the GAM347 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM347 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM347 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM347 are further described hereinbelow with

reference to Table 1.

[4737] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM347 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4738] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 348 (GAM348) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4739] GAM348 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM348 was detected is described hereinabove with reference to Figs. 2-8.

[4740] GAM348 gene, herein designated GAM GENE, and GAM348 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4741] GAM348 gene, herein designated GAM GENE, encodes a GAM348 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM348 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM348 precursor RNA is designated SEQ ID:325, and is provided

hereinbelow with reference to the sequence listing part.

[4742] GAM348 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM348 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4743] An enzyme complex designated DICER COMPLEX, dices the GAM348 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM348 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM348 RNA is designated SEQ ID:2922, and is provided hereinbelow with reference to the sequence listing part.

[4744] GAM348 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM348 target RNA, herein designated GAM TARGET RNA. GAM348 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[4745] GAM348 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM348 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM348 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM348 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM348 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4746] The complementary binding of GAM348 RNA, herein designated GAM RNA, to target binding sites on GAM348 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM348 target RNA, herein designated GAM TARGET RNA, into GAM348 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4747] It is appreciated that GAM348 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM348 target genes. The mRNA of each one of this plurality of GAM348 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM348 RNA, herein designated GAM RNA, and which when bound by GAM348 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM348 target proteins.

[4748] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM348 gene, herein designated GAM GENE, on one or more GAM348 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4749] It is yet further appreciated that specific functions, and accordingly utilities, of GAM348 correlate with, and may be deduced from, the identity of the target genes which GAM348 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4750] Nucleotide sequences of the GAM348 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM348 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM348 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM348 are further described hereinbelow with reference to Table 1.

[4751] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM348 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4752] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 349 (GAM349) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4753] GAM349 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM349 was detected is described hereinabove with reference to Figs. 2-8.

[4754] GAM349 gene, herein designated GAM GENE, and GAM349 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4755] GAM349 gene, herein designated GAM GENE, encodes a GAM349 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM349 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM349 precursor RNA is designated SEQ ID:326, and is provided hereinbelow with reference to the sequence listing part.

[4756] GAM349 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM349 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4757] An enzyme complex designated DICER COMPLEX, dices the GAM349 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM349 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM349 RNA is designated SEQ ID:2923, and is provided hereinbelow with reference to the sequence listing part.

[4758] GAM349 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM349 target RNA, herein designated

GAM TARGET RNA. GAM349 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4759] GAM349 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM349 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM349 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM349 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM349 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4760] The complementary binding of GAM349 RNA, herein designated GAM RNA, to target binding sites on GAM349 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM349 target RNA, herein designated GAM

TARGET RNA, into GAM349 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4761] It is appreciated that GAM349 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM349 target genes. The mRNA of each one of this plurality of GAM349 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM349 RNA, herein designated GAM RNA, and which when bound by GAM349 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM349 target proteins.

[4762] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM349 gene, herein designated GAM GENE, on one or more GAM349 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4763] It is yet further appreciated that specific functions, and accordingly utilities, of GAM349 correlate with, and may be deduced from, the identity of the target

genes which GAM349 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4764] Nucleotide sequences of the GAM349 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM349 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM349 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM349 are further described hereinbelow with reference to Table 1.

[4765] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM349 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4766] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 350 (GAM350) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4767] GAM350 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM350 was detected is described hereinabove with reference to Figs. 2-8.

[4768] GAM350 gene, herein designated GAM GENE, and GAM350 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[4769] GAM350 gene, herein designated GAM GENE, encodes a GAM350 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM350 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM350 precursor RNA is designated SEQ ID:327, and is provided hereinbelow with reference to the sequence listing part.

[4770] GAM350 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4771] An enzyme complex designated DICER COMPLEX, dices the GAM350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM350 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM350 RNA is designated SEQ ID:2924, and is provided

hereinbelow with reference to the sequence listing part.

[4772] GAM350 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM350 target RNA, herein designated GAM TARGET RNA. GAM350 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4773] GAM350 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM350 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM350 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM350 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM350 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4774] The complementary binding of GAM350 RNA, herein designated GAM RNA, to target binding sites on GAM350 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM350 target RNA, herein designated GAM TARGET RNA, into GAM350 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4775] It is appreciated that GAM350 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM350 target genes. The mRNA of each one of this plurality of GAM350 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM350 RNA, herein designated GAM RNA, and which when bound by GAM350 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM350 target proteins.

[4776] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM350 gene, herein designated GAM GENE, on one or more GAM350 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4777] It is yet further appreciated that specific functions, and accordingly utilities, of GAM350 correlate with, and may be deduced from, the identity of the target genes which GAM350 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4778] Nucleotide sequences of the GAM350 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM350 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM350 are further described hereinbelow with reference to Table 1.

[4779] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM350 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4780] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 351 (GAM351) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4781] GAM351 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM351 was detected is

described hereinabove with reference to Figs. 2-8.

[4782] GAM351 gene, herein designated GAM GENE, and GAM351 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4783] GAM351 gene, herein designated GAM GENE, encodes a GAM351 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM351 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM351 precursor RNA is designated SEQ ID:328, and is provided hereinbelow with reference to the sequence listing part.

[4784] GAM351 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM351 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4785] An enzyme complex designated DICER COMPLEX, dices the GAM351 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM351 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM351 RNA is designated SEQ ID:2925, and is provided hereinbelow with reference to the sequence listing part.

[4786] GAM351 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM351 target RNA, herein designated GAM TARGET RNA. GAM351 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4787] GAM351 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM351 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM351 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM351 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM351 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4788] The complementary binding of GAM351 RNA, herein designated GAM RNA, to target binding sites on GAM351 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM351 target RNA, herein designated GAM TARGET RNA, into GAM351 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4789] It is appreciated that GAM351 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM351 target genes. The mRNA of each one of this plurality of GAM351 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM351 RNA, herein designated GAM RNA, and which when bound by GAM351 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM351 target proteins.

[4790] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM351 gene, herein designated GAM GENE, on one or more GAM351 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4791] It is yet further appreciated that specific functions, and accordingly utilities, of GAM351 correlate with, and may be deduced from, the identity of the target genes which GAM351 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4792] Nucleotide sequences of the GAM351 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM351 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM351 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM351 are further described hereinbelow with reference to Table 1.

[4793] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM351 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4794] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 352 (GAM352) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4795] GAM352 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM352 was detected is described hereinabove with reference to Figs. 2-8.

[4796] GAM352 gene, herein designated GAM GENE, and GAM352 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4797] GAM352 gene, herein designated GAM GENE, encodes a GAM352 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM352 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM352 precursor RNA is designated SEQ ID:329, and is provided hereinbelow with reference to the sequence listing part.

[4798] GAM352 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM352 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4799] An enzyme complex designated DICER COMPLEX, dices the GAM352 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM352 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM352 RNA is designated SEQ ID:2926, and is provided hereinbelow with reference to the sequence listing part.

[4800] GAM352 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM352 target RNA, herein designated GAM TARGET RNA. GAM352 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4801] GAM352 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM352 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM352 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM352 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM352 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4802] The complementary binding of GAM352 RNA, herein designated GAM RNA, to target binding sites on GAM352 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM352 target RNA, herein designated GAM TARGET RNA, into GAM352 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4803] It is appreciated that GAM352 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM352 target genes. The mRNA of each one of this plurality of GAM352 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM352 RNA, herein designated GAM RNA, and which when bound by GAM352 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM352 target proteins.

[4804] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM352 gene, herein designated GAM GENE, on one or more GAM352 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4805] It is yet further appreciated that specific functions, and accordingly utilities, of GAM352 correlate with, and may be deduced from, the identity of the target genes which GAM352 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4806] Nucleotide sequences of the GAM352 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM352 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM352 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM352 are further described hereinbelow with reference to Table 1.

[4807] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM352 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4808] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 353 (GAM353) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4809] GAM353 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM353 was detected is described hereinabove with reference to Figs. 2-8.

[4810] GAM353 gene, herein designated GAM GENE, and GAM353 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4811] GAM353 gene, herein designated GAM GENE, encodes a GAM353 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM353 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM353 precursor RNA is designated SEQ ID:330, and is provided hereinbelow with reference to the sequence listing part.

[4812] GAM353 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM353 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4813] An enzyme complex designated DICER COMPLEX, dices the GAM353 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM353 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM353 RNA is designated SEQ ID:2927, and is provided hereinbelow with reference to the sequence listing part.

[4814] GAM353 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM353 target RNA, herein designated GAM TARGET RNA. GAM353 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4815] GAM353 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM353 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM353 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM353 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM353 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4816] The complementary binding of GAM353 RNA, herein designated GAM RNA, to target binding sites on GAM353 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM353 target RNA, herein designated GAM TARGET RNA, into GAM353 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4817] It is appreciated that GAM353 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM353 target genes. The mRNA of each one of this plurality of GAM353 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM353 RNA, herein designated GAM RNA, and which when bound by GAM353 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM353 target proteins.

[4818] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM353 gene, herein designated GAM GENE, on one or more

GAM353 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4819] It is yet further appreciated that specific functions, and accordingly utilities, of GAM353 correlate with, and may be deduced from, the identity of the target genes which GAM353 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4820] Nucleotide sequences of the GAM353 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM353 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM353 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM353 are further described hereinbelow with reference to Table 1.

[4821] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM353 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4822] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 354 (GAM354) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4823] GAM354 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM354 was detected is described hereinabove with reference to Figs. 2-8.

[4824] GAM354 gene, herein designated GAM GENE, and GAM354 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4825] GAM354 gene, herein designated GAM GENE, encodes a GAM354 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM354 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM354 precursor RNA is designated SEQ ID:331, and is provided hereinbelow with reference to the sequence listing part.

[4826] GAM354 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM354 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4827] An enzyme complex designated DICER COMPLEX, dices the GAM354 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM354 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM354 RNA is designated SEQ ID:2929, and is provided hereinbelow with reference to the sequence listing part.

[4828] GAM354 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM354 target RNA, herein designated GAM TARGET RNA. GAM354 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4829] GAM354 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM354 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM354 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM354 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM354 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4830] The complementary binding of GAM354 RNA, herein designated GAM RNA, to target binding sites on GAM354 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM354 target RNA, herein designated GAM TARGET RNA, into GAM354 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4831] It is appreciated that GAM354 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM354 target genes. The mRNA of each one of this plurality of GAM354 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM354 RNA, herein designated GAM RNA, and which when bound by GAM354 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM354 target proteins.

[4832] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM354 gene, herein designated GAM GENE, on one or more GAM354 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4833] It is yet further appreciated that specific functions, and accordingly utilities, of GAM354 correlate with, and may be deduced from, the identity of the target genes which GAM354 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4834] Nucleotide sequences of the GAM354 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM354 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM354 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM354 are further described hereinbelow with reference to Table 1.

[4835] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM354 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4836] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 355 (GAM355) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4837] GAM355 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM355 was detected is described hereinabove with reference to Figs. 2-8.

[4838] GAM355 gene, herein designated GAM GENE, and GAM355 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4839] GAM355 gene, herein designated GAM GENE, encodes a GAM355 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM355 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM355 precursor RNA is designated SEQ ID:332, and is provided hereinbelow with reference to the sequence listing part.

[4840] GAM355 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM355 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4841] An enzyme complex designated DICER COMPLEX, dices the GAM355 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM355 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM355 RNA is designated SEQ ID:2928, and is provided hereinbelow with reference to the sequence listing part.

[4842] GAM355 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM355 target RNA, herein designated GAM TARGET RNA. GAM355 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4843] GAM355 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM355

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM355 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM355 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM355 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4844] The complementary binding of GAM355 RNA, herein designated GAM RNA, to target binding sites on GAM355 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM355 target RNA, herein designated GAM TARGET RNA, into GAM355 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4845] It is appreciated that GAM355 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM355 target genes. The mRNA of each one of this plurality of GAM355 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM355 RNA, herein designated GAM RNA, and which when bound by GAM355 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM355 target proteins.

[4846] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM355 gene, herein designated GAM GENE, on one or more GAM355 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4847] It is yet further appreciated that specific functions, and accordingly utilities, of GAM355 correlate with, and may be deduced from, the identity of the target genes which GAM355 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4848] Nucleotide sequences of the GAM355 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM355 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM355 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM355 are further described hereinbelow with

reference to Table 1.

[4849] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM355 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4850] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 356 (GAM356) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4851] GAM356 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM356 was detected is described hereinabove with reference to Figs. 2-8.

[4852] GAM356 gene, herein designated GAM GENE, and GAM356 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4853] GAM356 gene, herein designated GAM GENE, encodes a GAM356 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM356 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM356 precursor RNA is designated SEQ ID:333, and is provided

hereinbelow with reference to the sequence listing part.

[4854] GAM356 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM356 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4855] An enzyme complex designated DICER COMPLEX, dices the GAM356 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM356 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM356 RNA is designated SEQ ID:2930, and is provided hereinbelow with reference to the sequence listing part.

[4856] GAM356 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM356 target RNA, herein designated GAM TARGET RNA. GAM356 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[4857] GAM356 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM356 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM356 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM356 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM356 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4858] The complementary binding of GAM356 RNA, herein designated GAM RNA, to target binding sites on GAM356 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM356 target RNA, herein designated GAM TARGET RNA, into GAM356 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4859] It is appreciated that GAM356 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM356 target genes. The mRNA of each one of this plurality of GAM356 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM356 RNA, herein designated GAM RNA, and which when bound by GAM356 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM356 target proteins.

[4860] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM356 gene, herein designated GAM GENE, on one or more GAM356 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4861] It is yet further appreciated that specific functions, and accordingly utilities, of GAM356 correlate with, and may be deduced from, the identity of the target genes which GAM356 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4862] Nucleotide sequences of the GAM356 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM356 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM356 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM356 are further described hereinbelow with reference to Table 1.

[4863] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM356 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4864] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 357 (GAM357) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4865] GAM357 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM357 was detected is described hereinabove with reference to Figs. 2-8.

[4866] GAM357 gene, herein designated GAM GENE, and GAM357 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4867] GAM357 gene, herein designated GAM GENE, encodes a GAM357 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM357 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM357 precursor RNA is designated SEQ ID:334, and is provided hereinbelow with reference to the sequence listing part.

[4868] GAM357 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM357 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4869] An enzyme complex designated DICER COMPLEX, dices the GAM357 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM357 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM357 RNA is designated SEQ ID:2931, and is provided hereinbelow with reference to the sequence listing part.

[4870] GAM357 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM357 target RNA, herein designated

GAM TARGET RNA. GAM357 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4871] GAM357 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM357 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM357 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM357 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM357 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4872] The complementary binding of GAM357 RNA, herein designated GAM RNA, to target binding sites on GAM357 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM357 target RNA, herein designated GAM

TARGET RNA, into GAM357 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4873] It is appreciated that GAM357 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM357 target genes. The mRNA of each one of this plurality of GAM357 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM357 RNA, herein designated GAM RNA, and which when bound by GAM357 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM357 target proteins.

[4874] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM357 gene, herein designated GAM GENE, on one or more GAM357 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4875] It is yet further appreciated that specific functions, and accordingly utilities, of GAM357 correlate with, and may be deduced from, the identity of the target

genes which GAM357 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4876] Nucleotide sequences of the GAM357 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM357 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM357 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM357 are further described hereinbelow with reference to Table 1.

[4877] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM357 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4878] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 358 (GAM358) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4879] GAM358 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM358 was detected is described hereinabove with reference to Figs. 2-8.

[4880] GAM358 gene, herein designated GAM GENE, and GAM358 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[4881] GAM358 gene, herein designated GAM GENE, encodes a GAM358 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM358 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM358 precursor RNA is designated SEQ ID:335, and is provided hereinbelow with reference to the sequence listing part.

[4882] GAM358 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM358 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4883] An enzyme complex designated DICER COMPLEX, dices the GAM358 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM358 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM358 RNA is designated SEQ ID:2932, and is provided

hereinbelow with reference to the sequence listing part.

[4884] GAM358 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM358 target RNA, herein designated GAM TARGET RNA. GAM358 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4885] GAM358 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM358 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM358 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM358 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM358 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4886] The complementary binding of GAM358 RNA, herein designated GAM RNA, to target binding sites on GAM358 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM358 target RNA, herein designated GAM TARGET RNA, into GAM358 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4887] It is appreciated that GAM358 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM358 target genes. The mRNA of each one of this plurality of GAM358 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM358 RNA, herein designated GAM RNA, and which when bound by GAM358 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM358 target proteins.

[4888] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM358 gene, herein designated GAM GENE, on one or more GAM358 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4889] It is yet further appreciated that specific functions, and accordingly utilities, of GAM358 correlate with, and may be deduced from, the identity of the target genes which GAM358 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4890] Nucleotide sequences of the GAM358 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM358 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM358 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM358 are further described hereinbelow with reference to Table 1.

[4891] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM358 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4892] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 359 (GAM359) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4893] GAM359 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM359 was detected is

described hereinabove with reference to Figs. 2-8.

[4894] GAM359 gene, herein designated GAM GENE, and GAM359 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4895] GAM359 gene, herein designated GAM GENE, encodes a GAM359 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM359 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM359 precursor RNA is designated SEQ ID:336, and is provided hereinbelow with reference to the sequence listing part.

[4896] GAM359 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM359 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4897] An enzyme complex designated DICER COMPLEX, dices the GAM359 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM359 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM359 RNA is designated SEQ ID:2933, and is provided hereinbelow with reference to the sequence listing part.

[4898] GAM359 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM359 target RNA, herein designated GAM TARGET RNA. GAM359 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4899] GAM359 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM359 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM359 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM359 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM359 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4900] The complementary binding of GAM359 RNA, herein designated GAM RNA, to target binding sites on GAM359 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM359 target RNA, herein designated GAM TARGET RNA, into GAM359 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4901] It is appreciated that GAM359 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM359 target genes. The mRNA of each one of this plurality of GAM359 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM359 RNA, herein designated GAM RNA, and which when bound by GAM359 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM359 target proteins.

[4902] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM359 gene, herein designated GAM GENE, on one or more GAM359 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4903] It is yet further appreciated that specific functions, and accordingly utilities, of GAM359 correlate with, and may be deduced from, the identity of the target genes which GAM359 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4904] Nucleotide sequences of the GAM359 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM359 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM359 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM359 are further described hereinbelow with reference to Table 1.

[4905] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM359 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4906] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 360 (GAM360) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4907] GAM360 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM360 was detected is described hereinabove with reference to Figs. 2-8.

[4908] GAM360 gene, herein designated GAM GENE, and GAM360 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4909] GAM360 gene, herein designated GAM GENE, encodes a GAM360 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM360 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM360 precursor RNA is designated SEQ ID:337, and is provided hereinbelow with reference to the sequence listing part.

[4910] GAM360 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM360 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4911] An enzyme complex designated DICER COMPLEX, dices the GAM360 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM360 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM360 RNA is designated SEQ ID:2934, and is provided hereinbelow with reference to the sequence listing part.

[4912] GAM360 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM360 target RNA, herein designated GAM TARGET RNA. GAM360 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4913] GAM360 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM360 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM360 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM360 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM360 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4914] The complementary binding of GAM360 RNA, herein designated GAM RNA, to target binding sites on GAM360 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM360 target RNA, herein designated GAM TARGET RNA, into GAM360 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4915] It is appreciated that GAM360 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM360 target genes. The mRNA of each one of this plurality of GAM360 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM360 RNA, herein designated GAM RNA, and which when bound by GAM360 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM360 target proteins.

[4916] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM360 gene, herein designated GAM GENE, on one or more GAM360 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4917] It is yet further appreciated that specific functions, and accordingly utilities, of GAM360 correlate with, and may be deduced from, the identity of the target genes which GAM360 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4918] Nucleotide sequences of the GAM360 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM360 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM360 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM360 are further described hereinbelow with reference to Table 1.

[4919] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM360 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4920] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 361 (GAM361) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4921] GAM361 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM361 was detected is described hereinabove with reference to Figs. 2-8.

[4922] GAM361 gene, herein designated GAM GENE, and GAM361 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4923] GAM361 gene, herein designated GAM GENE, encodes a GAM361 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM361 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM361 precursor RNA is designated SEQ ID:338, and is provided hereinbelow with reference to the sequence listing part.

[4924] GAM361 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4925] An enzyme complex designated DICER COMPLEX, dices the GAM361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM361 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM361 RNA is designated SEQ ID:2935, and is provided hereinbelow with reference to the sequence listing part.

[4926] GAM361 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM361 target RNA, herein designated GAM TARGET RNA. GAM361 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4927] GAM361 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM361 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM361 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM361 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM361 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4928] The complementary binding of GAM361 RNA, herein designated GAM RNA, to target binding sites on GAM361 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM361 target RNA, herein designated GAM TARGET RNA, into GAM361 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4929] It is appreciated that GAM361 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM361 target genes. The mRNA of each one of this plurality of GAM361 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM361 RNA, herein designated GAM RNA, and which when bound by GAM361 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM361 target proteins.

[4930] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM361 gene, herein designated GAM GENE, on one or more

GAM361 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4931] It is yet further appreciated that specific functions, and accordingly utilities, of GAM361 correlate with, and may be deduced from, the identity of the target genes which GAM361 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4932] Nucleotide sequences of the GAM361 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM361 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM361 are further described hereinbelow with reference to Table 1.

[4933] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM361 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4934] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 362 (GAM362) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4935] GAM362 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM362 was detected is described hereinabove with reference to Figs. 2-8.

[4936] GAM362 gene, herein designated GAM GENE, and GAM362 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4937] GAM362 gene, herein designated GAM GENE, encodes a GAM362 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM362 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM362 precursor RNA is designated SEQ ID:339, and is provided hereinbelow with reference to the sequence listing part.

[4938] GAM362 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM362 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4939] An enzyme complex designated DICER COMPLEX, dices the GAM362 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM362 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM362 RNA is designated SEQ ID:2936, and is provided hereinbelow with reference to the sequence listing part.

[4940] GAM362 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM362 target RNA, herein designated GAM TARGET RNA. GAM362 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4941] GAM362 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM362 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM362 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM362 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM362 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4942] The complementary binding of GAM362 RNA, herein designated GAM RNA, to target binding sites on GAM362 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM362 target RNA, herein designated GAM TARGET RNA, into GAM362 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4943] It is appreciated that GAM362 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM362 target genes. The mRNA of each one of this plurality of GAM362 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM362 RNA, herein designated GAM RNA, and which when bound by GAM362 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM362 target proteins.

[4944] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM362 gene, herein designated GAM GENE, on one or more GAM362 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4945] It is yet further appreciated that specific functions, and accordingly utilities, of GAM362 correlate with, and may be deduced from, the identity of the target genes which GAM362 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4946] Nucleotide sequences of the GAM362 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM362 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM362 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM362 are further described hereinbelow with reference to Table 1.

[4947] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM362 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4948] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 363 (GAM363) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4949] GAM363 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM363 was detected is described hereinabove with reference to Figs. 2-8.

[4950] GAM363 gene, herein designated GAM GENE, and GAM363 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4951] GAM363 gene, herein designated GAM GENE, encodes a GAM363 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM363 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM363 precursor RNA is designated SEQ ID:340, and is provided hereinbelow with reference to the sequence listing part.

[4952] GAM363 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM363 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4953] An enzyme complex designated DICER COMPLEX, dices the GAM363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM363 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM363 RNA is designated SEQ ID:2937, and is provided hereinbelow with reference to the sequence listing part.

[4954] GAM363 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM363 target RNA, herein designated GAM TARGET RNA. GAM363 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4955] GAM363 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM363

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM363 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM363 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM363 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4956] The complementary binding of GAM363 RNA, herein designated GAM RNA, to target binding sites on GAM363 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM363 target RNA, herein designated GAM TARGET RNA, into GAM363 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4957] It is appreciated that GAM363 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM363 target genes. The mRNA of each one of this plurality of GAM363 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM363 RNA, herein designated GAM RNA, and which when bound by GAM363 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM363 target proteins.

[4958] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM363 gene, herein designated GAM GENE, on one or more GAM363 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4959] It is yet further appreciated that specific functions, and accordingly utilities, of GAM363 correlate with, and may be deduced from, the identity of the target genes which GAM363 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4960] Nucleotide sequences of the GAM363 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM363 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM363 are further described hereinbelow with

reference to Table 1.

[4961] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM363 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4962] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 364 (GAM364) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4963] GAM364 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM364 was detected is described hereinabove with reference to Figs. 2-8.

[4964] GAM364 gene, herein designated GAM GENE, and GAM364 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4965] GAM364 gene, herein designated GAM GENE, encodes a GAM364 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM364 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM364 precursor RNA is designated SEQ ID:341, and is provided

hereinbelow with reference to the sequence listing part.

[4966] GAM364 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM364 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4967] An enzyme complex designated DICER COMPLEX, dices the GAM364 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM364 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM364 RNA is designated SEQ ID:2938, and is provided hereinbelow with reference to the sequence listing part.

[4968] GAM364 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM364 target RNA, herein designated GAM TARGET RNA. GAM364 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[4969] GAM364 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM364 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM364 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM364 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM364 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4970] The complementary binding of GAM364 RNA, herein designated GAM RNA, to target binding sites on GAM364 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM364 target RNA, herein designated GAM TARGET RNA, into GAM364 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4971] It is appreciated that GAM364 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM364 target genes. The mRNA of each one of this plurality of GAM364 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM364 RNA, herein designated GAM RNA, and which when bound by GAM364 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM364 target proteins.

[4972] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM364 gene, herein designated GAM GENE, on one or more GAM364 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4973] It is yet further appreciated that specific functions, and accordingly utilities, of GAM364 correlate with, and may be deduced from, the identity of the target genes which GAM364 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4974] Nucleotide sequences of the GAM364 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM364 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM364 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM364 are further described hereinbelow with reference to Table 1.

[4975] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM364 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4976] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 365 (GAM365) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4977] GAM365 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM365 was detected is described hereinabove with reference to Figs. 2-8.

[4978] GAM365 gene, herein designated GAM GENE, and GAM365 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[4979] GAM365 gene, herein designated GAM GENE, encodes a GAM365 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM365 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM365 precursor RNA is designated SEQ ID:342, and is provided hereinbelow with reference to the sequence listing part.

[4980] GAM365 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM365 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4981] An enzyme complex designated DICER COMPLEX, dices the GAM365 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM365 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM365 RNA is designated SEQ ID:2939, and is provided hereinbelow with reference to the sequence listing part.

[4982] GAM365 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM365 target RNA, herein designated

GAM TARGET RNA. GAM365 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4983] GAM365 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM365 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM365 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM365 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM365 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4984] The complementary binding of GAM365 RNA, herein designated GAM RNA, to target binding sites on GAM365 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM365 target RNA, herein designated GAM

TARGET RNA, into GAM365 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4985] It is appreciated that GAM365 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM365 target genes. The mRNA of each one of this plurality of GAM365 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM365 RNA, herein designated GAM RNA, and which when bound by GAM365 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM365 target proteins.

[4986] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM365 gene, herein designated GAM GENE, on one or more GAM365 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[4987] It is yet further appreciated that specific functions, and accordingly utilities, of GAM365 correlate with, and may be deduced from, the identity of the target

genes which GAM365 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[4988] Nucleotide sequences of the GAM365 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM365 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM365 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM365 are further described hereinbelow with reference to Table 1.

[4989] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM365 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[4990] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 366 (GAM366) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[4991] GAM366 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM366 was detected is described hereinabove with reference to Figs. 2-8.

[4992] GAM366 gene, herein designated GAM GENE, and GAM366 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[4993] GAM366 gene, herein designated GAM GENE, encodes a GAM366 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM366 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM366 precursor RNA is designated SEQ ID:343, and is provided hereinbelow with reference to the sequence listing part.

[4994] GAM366 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM366 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[4995] An enzyme complex designated DICER COMPLEX, dices the GAM366 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM366 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM366 RNA is designated SEQ ID:2940, and is provided

hereinbelow with reference to the sequence listing part.

[4996] GAM366 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM366 target RNA, herein designated GAM TARGET RNA. GAM366 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[4997] GAM366 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM366 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM366 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM366 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM366 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[4998] The complementary binding of GAM366 RNA, herein designated GAM RNA, to target binding sites on GAM366 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM366 target RNA, herein designated GAM TARGET RNA, into GAM366 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[4999] It is appreciated that GAM366 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM366 target genes. The mRNA of each one of this plurality of GAM366 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM366 RNA, herein designated GAM RNA, and which when bound by GAM366 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM366 target proteins.

[5000] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM366 gene, herein designated GAM GENE, on one or more GAM366 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5001] It is yet further appreciated that specific functions, and accordingly utilities, of GAM366 correlate with, and may be deduced from, the identity of the target genes which GAM366 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5002] Nucleotide sequences of the GAM366 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM366 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM366 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM366 are further described hereinbelow with reference to Table 1.

[5003] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM366 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5004] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 367 (GAM367) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5005] GAM367 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM367 was detected is

described hereinabove with reference to Figs. 2-8.

[5006] GAM367 gene, herein designated GAM GENE, and GAM367 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5007] GAM367 gene, herein designated GAM GENE, encodes a GAM367 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM367 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM367 precursor RNA is designated SEQ ID:344, and is provided hereinbelow with reference to the sequence listing part.

[5008] GAM367 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM367 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5009] An enzyme complex designated DICER COMPLEX, dices the GAM367 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM367 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM367 RNA is designated SEQ ID:2941, and is provided hereinbelow with reference to the sequence listing part.

[5010] GAM367 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM367 target RNA, herein designated GAM TARGET RNA. GAM367 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5011] GAM367 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM367 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM367 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM367 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM367 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5012] The complementary binding of GAM367 RNA, herein designated GAM RNA, to target binding sites on GAM367 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM367 target RNA, herein designated GAM TARGET RNA, into GAM367 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5013] It is appreciated that GAM367 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM367 target genes. The mRNA of each one of this plurality of GAM367 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM367 RNA, herein designated GAM RNA, and which when bound by GAM367 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM367 target proteins.

[5014] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM367 gene, herein designated GAM GENE, on one or more GAM367 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5015] It is yet further appreciated that specific functions, and accordingly utilities, of GAM367 correlate with, and may be deduced from, the identity of the target genes which GAM367 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5016] Nucleotide sequences of the GAM367 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM367 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM367 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM367 are further described hereinbelow with reference to Table 1.

[5017] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM367 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5018] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 368 (GAM368) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5019] GAM368 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM368 was detected is described hereinabove with reference to Figs. 2-8.

[5020] GAM368 gene, herein designated GAM GENE, and GAM368 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5021] GAM368 gene, herein designated GAM GENE, encodes a GAM368 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM368 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM368 precursor RNA is designated SEQ ID:345, and is provided hereinbelow with reference to the sequence listing part.

[5022] GAM368 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM368 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5023] An enzyme complex designated DICER COMPLEX, dices the GAM368 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM368 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM368 RNA is designated SEQ ID:2942, and is provided hereinbelow with reference to the sequence listing part.

[5024] GAM368 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM368 target RNA, herein designated GAM TARGET RNA. GAM368 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5025] GAM368 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM368 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM368 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM368 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM368 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5026] The complementary binding of GAM368 RNA, herein designated GAM RNA, to target binding sites on GAM368 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM368 target RNA, herein designated GAM TARGET RNA, into GAM368 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5027] It is appreciated that GAM368 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM368 target genes. The mRNA of each one of this plurality of GAM368 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM368 RNA, herein designated GAM RNA, and which when bound by GAM368 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM368 target proteins.

[5028] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM368 gene, herein designated GAM GENE, on one or more GAM368 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5029] It is yet further appreciated that specific functions, and accordingly utilities, of GAM368 correlate with, and may be deduced from, the identity of the target genes which GAM368 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5030] Nucleotide sequences of the GAM368 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM368 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM368 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM368 are further described hereinbelow with reference to Table 1.

[5031] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM368 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5032] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 369 (GAM369) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5033] GAM369 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM369 was detected is described hereinabove with reference to Figs. 2-8.

[5034] GAM369 gene, herein designated GAM GENE, and GAM369 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5035] GAM369 gene, herein designated GAM GENE, encodes a GAM369 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM369 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM369 precursor RNA is designated SEQ ID:346, and is provided hereinbelow with reference to the sequence listing part.

[5036] GAM369 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM369 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5037] An enzyme complex designated DICER COMPLEX, dices the GAM369 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM369 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM369 RNA is designated SEQ ID:2943, and is provided hereinbelow with reference to the sequence listing part.

[5038] GAM369 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM369 target RNA, herein designated GAM TARGET RNA. GAM369 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5039] GAM369 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM369 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM369 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM369 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM369 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5040] The complementary binding of GAM369 RNA, herein designated GAM RNA, to target binding sites on GAM369 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM369 target RNA, herein designated GAM TARGET RNA, into GAM369 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5041] It is appreciated that GAM369 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM369 target genes. The mRNA of each one of this plurality of GAM369 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM369 RNA, herein designated GAM RNA, and which when bound by GAM369 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM369 target proteins.

[5042] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM369 gene, herein designated GAM GENE, on one or more

GAM369 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5043] It is yet further appreciated that specific functions, and accordingly utilities, of GAM369 correlate with, and may be deduced from, the identity of the target genes which GAM369 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5044] Nucleotide sequences of the GAM369 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM369 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM369 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM369 are further described hereinbelow with reference to Table 1.

[5045] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM369 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5046] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 370 (GAM370) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5047] GAM370 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM370 was detected is described hereinabove with reference to Figs. 2-8.

[5048] GAM370 gene, herein designated GAM GENE, and GAM370 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5049] GAM370 gene, herein designated GAM GENE, encodes a GAM370 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM370 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM370 precursor RNA is designated SEQ ID:347, and is provided hereinbelow with reference to the sequence listing part.

[5050] GAM370 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM370 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5051] An enzyme complex designated DICER COMPLEX, dices the GAM370 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM370 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM370 RNA is designated SEQ ID:2944, and is provided hereinbelow with reference to the sequence listing part.

[5052] GAM370 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM370 target RNA, herein designated GAM TARGET RNA. GAM370 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5053] GAM370 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM370 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM370 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM370 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM370 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5054] The complementary binding of GAM370 RNA, herein designated GAM RNA, to target binding sites on GAM370 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM370 target RNA, herein designated GAM TARGET RNA, into GAM370 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5055] It is appreciated that GAM370 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM370 target genes. The mRNA of each one of this plurality of GAM370 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM370 RNA, herein designated GAM RNA, and which when bound by GAM370 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM370 target proteins.

[5056] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM370 gene, herein designated GAM GENE, on one or more GAM370 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5057] It is yet further appreciated that specific functions, and accordingly utilities, of GAM370 correlate with, and may be deduced from, the identity of the target genes which GAM370 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5058] Nucleotide sequences of the GAM370 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM370 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM370 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM370 are further described hereinbelow with reference to Table 1.

[5059] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM370 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5060] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 371 (GAM371) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5061] GAM371 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM371 was detected is described hereinabove with reference to Figs. 2-8.

[5062] GAM371 gene, herein designated GAM GENE, and GAM371 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5063] GAM371 gene, herein designated GAM GENE, encodes a GAM371 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM371 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM371 precursor RNA is designated SEQ ID:348, and is provided hereinbelow with reference to the sequence listing part.

[5064] GAM371 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM371 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5065] An enzyme complex designated DICER COMPLEX, dices the GAM371 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM371 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM371 RNA is designated SEQ ID:2945, and is provided hereinbelow with reference to the sequence listing part.

[5066] GAM371 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM371 target RNA, herein designated GAM TARGET RNA. GAM371 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5067] GAM371 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM371

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM371 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM371 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM371 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5068] The complementary binding of GAM371 RNA, herein designated GAM RNA, to target binding sites on GAM371 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM371 target RNA, herein designated GAM TARGET RNA, into GAM371 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5069] It is appreciated that GAM371 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM371 target genes. The mRNA of each one of this plurality of GAM371 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM371 RNA, herein designated GAM RNA, and which when bound by GAM371 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM371 target proteins.

[5070] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM371 gene, herein designated GAM GENE, on one or more GAM371 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5071] It is yet further appreciated that specific functions, and accordingly utilities, of GAM371 correlate with, and may be deduced from, the identity of the target genes which GAM371 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5072] Nucleotide sequences of the GAM371 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM371 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM371 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM371 are further described hereinbelow with

reference to Table 1.

[5073] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM371 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5074] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 372 (GAM372) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5075] GAM372 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM372 was detected is described hereinabove with reference to Figs. 2-8.

[5076] GAM372 gene, herein designated GAM GENE, and GAM372 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5077] GAM372 gene, herein designated GAM GENE, encodes a GAM372 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM372 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM372 precursor RNA is designated SEQ ID:349, and is provided

hereinbelow with reference to the sequence listing part.

[5078] GAM372 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM372 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5079] An enzyme complex designated DICER COMPLEX, dices the GAM372 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM372 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM372 RNA is designated SEQ ID:2947, and is provided hereinbelow with reference to the sequence listing part.

[5080] GAM372 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM372 target RNA, herein designated GAM TARGET RNA. GAM372 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[5081] GAM372 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM372 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM372 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM372 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM372 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5082] The complementary binding of GAM372 RNA, herein designated GAM RNA, to target binding sites on GAM372 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM372 target RNA, herein designated GAM TARGET RNA, into GAM372 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5083] It is appreciated that GAM372 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM372 target genes. The mRNA of each one of this plurality of GAM372 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM372 RNA, herein designated GAM RNA, and which when bound by GAM372 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM372 target proteins.

[5084] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM372 gene, herein designated GAM GENE, on one or more GAM372 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5085] It is yet further appreciated that specific functions, and accordingly utilities, of GAM372 correlate with, and may be deduced from, the identity of the target genes which GAM372 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5086] Nucleotide sequences of the GAM372 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM372 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM372 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM372 are further described hereinbelow with reference to Table 1.

[5087] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM372 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5088] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 373 (GAM373) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5089] GAM373 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM373 was detected is described hereinabove with reference to Figs. 2-8.

[5090] GAM373 gene, herein designated GAM GENE, and GAM373 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5091] GAM373 gene, herein designated GAM GENE, encodes a GAM373 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM373 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM373 precursor RNA is designated SEQ ID:350, and is provided hereinbelow with reference to the sequence listing part.

[5092] GAM373 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM373 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5093] An enzyme complex designated DICER COMPLEX, dices the GAM373 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM373 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM373 RNA is designated SEQ ID:2946, and is provided hereinbelow with reference to the sequence listing part.

[5094] GAM373 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM373 target RNA, herein designated

GAM TARGET RNA. GAM373 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5095] GAM373 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM373 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM373 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM373 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM373 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5096] The complementary binding of GAM373 RNA, herein designated GAM RNA, to target binding sites on GAM373 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM373 target RNA, herein designated GAM

TARGET RNA, into GAM373 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5097] It is appreciated that GAM373 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM373 target genes. The mRNA of each one of this plurality of GAM373 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM373 RNA, herein designated GAM RNA, and which when bound by GAM373 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM373 target proteins.

[5098] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM373 gene, herein designated GAM GENE, on one or more GAM373 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5099] It is yet further appreciated that specific functions, and accordingly utilities, of GAM373 correlate with, and may be deduced from, the identity of the target

genes which GAM373 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5100] Nucleotide sequences of the GAM373 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM373 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM373 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM373 are further described hereinbelow with reference to Table 1.

[5101] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM373 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5102] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 374 (GAM374) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5103] GAM374 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM374 was detected is described hereinabove with reference to Figs. 2-8.

[5104] GAM374 gene, herein designated GAM GENE, and GAM374 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[5105] GAM374 gene, herein designated GAM GENE, encodes a GAM374 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM374 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM374 precursor RNA is designated SEQ ID:351, and is provided hereinbelow with reference to the sequence listing part.

[5106] GAM374 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5107] An enzyme complex designated DICER COMPLEX, dices the GAM374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM374 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM374 RNA is designated SEQ ID:2948, and is provided

hereinbelow with reference to the sequence listing part.

[5108] GAM374 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM374 target RNA, herein designated GAM TARGET RNA. GAM374 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5109] GAM374 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM374 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM374 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM374 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM374 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5110] The complementary binding of GAM374 RNA, herein designated GAM RNA, to target binding sites on GAM374 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM374 target RNA, herein designated GAM TARGET RNA, into GAM374 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5111] It is appreciated that GAM374 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM374 target genes. The mRNA of each one of this plurality of GAM374 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM374 RNA, herein designated GAM RNA, and which when bound by GAM374 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM374 target proteins.

[5112] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM374 gene, herein designated GAM GENE, on one or more GAM374 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5113] It is yet further appreciated that specific functions, and accordingly utilities, of GAM374 correlate with, and may be deduced from, the identity of the target genes which GAM374 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5114] Nucleotide sequences of the GAM374 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM374 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM374 are further described hereinbelow with reference to Table 1.

[5115] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM374 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5116] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 375 (GAM375) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5117] GAM375 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM375 was detected is

described hereinabove with reference to Figs. 2-8.

[5118] GAM375 gene, herein designated GAM GENE, and GAM375 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5119] GAM375 gene, herein designated GAM GENE, encodes a GAM375 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM375 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM375 precursor RNA is designated SEQ ID:352, and is provided hereinbelow with reference to the sequence listing part.

[5120] GAM375 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM375 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5121] An enzyme complex designated DICER COMPLEX, dices the GAM375 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM375 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM375 RNA is designated SEQ ID:2949, and is provided hereinbelow with reference to the sequence listing part.

[5122] GAM375 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM375 target RNA, herein designated GAM TARGET RNA. GAM375 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5123] GAM375 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM375 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM375 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM375 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM375 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5124] The complementary binding of GAM375 RNA, herein designated GAM RNA, to target binding sites on GAM375 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM375 target RNA, herein designated GAM TARGET RNA, into GAM375 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5125] It is appreciated that GAM375 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM375 target genes. The mRNA of each one of this plurality of GAM375 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM375 RNA, herein designated GAM RNA, and which when bound by GAM375 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM375 target proteins.

[5126] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM375 gene, herein designated GAM GENE, on one or more

GAM375 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5127] It is yet further appreciated that specific functions, and accordingly utilities, of GAM375 correlate with, and may be deduced from, the identity of the target genes which GAM375 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5128] Nucleotide sequences of the GAM375 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM375 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM375 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM375 are further described hereinbelow with reference to Table 1.

[5129] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM375 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5130] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 376 (GAM376) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5131] GAM376 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM376 was detected is described hereinabove with reference to Figs. 2-8.

[5132] GAM376 gene, herein designated GAM GENE, and GAM376 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5133] GAM376 gene, herein designated GAM GENE, encodes a GAM376 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM376 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM376 precursor RNA is designated SEQ ID:353, and is provided hereinbelow with reference to the sequence listing part.

[5134] GAM376 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM376 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5135] An enzyme complex designated DICER COMPLEX, dices the GAM376 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM376 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM376 RNA is designated SEQ ID:2950, and is provided hereinbelow with reference to the sequence listing part.

[5136] GAM376 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM376 target RNA, herein designated GAM TARGET RNA. GAM376 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5137] GAM376 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM376 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM376 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM376 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM376 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5138] The complementary binding of GAM376 RNA, herein designated GAM RNA, to target binding sites on GAM376 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM376 target RNA, herein designated GAM TARGET RNA, into GAM376 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5139] It is appreciated that GAM376 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM376 target genes. The mRNA of each one of this plurality of GAM376 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM376 RNA, herein designated GAM RNA, and which when bound by GAM376 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM376 target proteins.

[5140] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM376 gene, herein designated GAM GENE, on one or more GAM376 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5141] It is yet further appreciated that specific functions, and accordingly utilities, of GAM376 correlate with, and may be deduced from, the identity of the target genes which GAM376 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5142] Nucleotide sequences of the GAM376 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM376 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM376 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM376 are further described hereinbelow with reference to Table 1.

[5143] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM376 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5144] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 377 (GAM377) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5145] GAM377 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM377 was detected is described hereinabove with reference to Figs. 2-8.

[5146] GAM377 gene, herein designated GAM GENE, and GAM377 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5147] GAM377 gene, herein designated GAM GENE, encodes a GAM377 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM377 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM377 precursor RNA is designated SEQ ID:354, and is provided hereinbelow with reference to the sequence listing part.

[5148] GAM377 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM377 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5149] An enzyme complex designated DICER COMPLEX, dices the GAM377 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM377 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM377 RNA is designated SEQ ID:2951, and is provided hereinbelow with reference to the sequence listing part.

[5150] GAM377 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM377 target RNA, herein designated GAM TARGET RNA. GAM377 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5151] GAM377 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM377

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM377 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM377 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM377 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5152] The complementary binding of GAM377 RNA, herein designated GAM RNA, to target binding sites on GAM377 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM377 target RNA, herein designated GAM TARGET RNA, into GAM377 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5153] It is appreciated that GAM377 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM377 target genes. The mRNA of each one of this plurality of GAM377 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM377 RNA, herein designated GAM RNA, and which when bound by GAM377 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM377 target proteins.

[5154] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM377 gene, herein designated GAM GENE, on one or more GAM377 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5155] It is yet further appreciated that specific functions, and accordingly utilities, of GAM377 correlate with, and may be deduced from, the identity of the target genes which GAM377 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5156] Nucleotide sequences of the GAM377 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM377 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM377 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM377 are further described hereinbelow with

reference to Table 1.

[5157] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM377 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5158] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 378 (GAM378) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5159] GAM378 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM378 was detected is described hereinabove with reference to Figs. 2-8.

[5160] GAM378 gene, herein designated GAM GENE, and GAM378 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5161] GAM378 gene, herein designated GAM GENE, encodes a GAM378 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM378 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM378 precursor RNA is designated SEQ ID:355, and is provided

hereinbelow with reference to the sequence listing part.

[5162] GAM378 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM378 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5163] An enzyme complex designated DICER COMPLEX, dices the GAM378 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM378 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM378 RNA is designated SEQ ID:2952, and is provided hereinbelow with reference to the sequence listing part.

[5164] GAM378 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM378 target RNA, herein designated GAM TARGET RNA. GAM378 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[5165] GAM378 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM378 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM378 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM378 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM378 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5166] The complementary binding of GAM378 RNA, herein designated GAM RNA, to target binding sites on GAM378 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM378 target RNA, herein designated GAM TARGET RNA, into GAM378 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5167] It is appreciated that GAM378 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM378 target genes. The mRNA of each one of this plurality of GAM378 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM378 RNA, herein designated GAM RNA, and which when bound by GAM378 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM378 target proteins.

[5168] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM378 gene, herein designated GAM GENE, on one or more GAM378 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5169] It is yet further appreciated that specific functions, and accordingly utilities, of GAM378 correlate with, and may be deduced from, the identity of the target genes which GAM378 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5170] Nucleotide sequences of the GAM378 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM378 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM378 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM378 are further described hereinbelow with reference to Table 1.

[5171] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM378 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5172] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 379 (GAM379) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5173] GAM379 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM379 was detected is described hereinabove with reference to Figs. 2-8.

[5174] GAM379 gene, herein designated GAM GENE, and GAM379 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5175] GAM379 gene, herein designated GAM GENE, encodes a GAM379 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM379 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM379 precursor RNA is designated SEQ ID:356, and is provided hereinbelow with reference to the sequence listing part.

[5176] GAM379 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM379 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5177] An enzyme complex designated DICER COMPLEX, dices the GAM379 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM379 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM379 RNA is designated SEQ ID:2953, and is provided hereinbelow with reference to the sequence listing part.

[5178] GAM379 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM379 target RNA, herein designated

GAM TARGET RNA. GAM379 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5179] GAM379 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM379 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM379 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM379 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM379 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5180] The complementary binding of GAM379 RNA, herein designated GAM RNA, to target binding sites on GAM379 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM379 target RNA, herein designated GAM

TARGET RNA, into GAM379 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5181] It is appreciated that GAM379 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM379 target genes. The mRNA of each one of this plurality of GAM379 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM379 RNA, herein designated GAM RNA, and which when bound by GAM379 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM379 target proteins.

[5182] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM379 gene, herein designated GAM GENE, on one or more GAM379 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5183] It is yet further appreciated that specific functions, and accordingly utilities, of GAM379 correlate with, and may be deduced from, the identity of the target

genes which GAM379 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5184] Nucleotide sequences of the GAM379 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM379 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM379 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM379 are further described hereinbelow with reference to Table 1.

[5185] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM379 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5186] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 380 (GAM380) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5187] GAM380 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM380 was detected is described hereinabove with reference to Figs. 2-8.

[5188] GAM380 gene, herein designated GAM GENE, and GAM380 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[5189] GAM380 gene, herein designated GAM GENE, encodes a GAM380 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM380 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM380 precursor RNA is designated SEQ ID:357, and is provided hereinbelow with reference to the sequence listing part.

[5190] GAM380 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM380 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5191] An enzyme complex designated DICER COMPLEX, dices the GAM380 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM380 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM380 RNA is designated SEQ ID:2954, and is provided

hereinbelow with reference to the sequence listing part.

[5192] GAM380 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM380 target RNA, herein designated GAM TARGET RNA. GAM380 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5193] GAM380 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM380 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM380 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM380 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM380 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5194] The complementary binding of GAM380 RNA, herein designated GAM RNA, to target binding sites on GAM380 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM380 target RNA, herein designated GAM TARGET RNA, into GAM380 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5195] It is appreciated that GAM380 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM380 target genes. The mRNA of each one of this plurality of GAM380 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM380 RNA, herein designated GAM RNA, and which when bound by GAM380 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM380 target proteins.

[5196] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM380 gene, herein designated GAM GENE, on one or more GAM380 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5197] It is yet further appreciated that specific functions, and accordingly utilities, of GAM380 correlate with, and may be deduced from, the identity of the target genes which GAM380 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5198] Nucleotide sequences of the GAM380 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM380 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM380 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM380 are further described hereinbelow with reference to Table 1.

[5199] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM380 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5200] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 381 (GAM381) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5201] GAM381 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM381 was detected is

described hereinabove with reference to Figs. 2-8.

[5202] GAM381 gene, herein designated GAM GENE, and GAM381 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5203] GAM381 gene, herein designated GAM GENE, encodes a GAM381 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM381 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM381 precursor RNA is designated SEQ ID:358, and is provided hereinbelow with reference to the sequence listing part.

[5204] GAM381 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM381 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5205] An enzyme complex designated DICER COMPLEX, dices the GAM381 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM381 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM381 RNA is designated SEQ ID:2955, and is provided hereinbelow with reference to the sequence listing part.

[5206] GAM381 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM381 target RNA, herein designated GAM TARGET RNA. GAM381 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5207] GAM381 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM381 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM381 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM381 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM381 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5208] The complementary binding of GAM381 RNA, herein designated GAM RNA, to target binding sites on GAM381 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM381 target RNA, herein designated GAM TARGET RNA, into GAM381 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5209] It is appreciated that GAM381 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM381 target genes. The mRNA of each one of this plurality of GAM381 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM381 RNA, herein designated GAM RNA, and which when bound by GAM381 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM381 target proteins.

[5210] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM381 gene, herein designated GAM GENE, on one or more GAM381 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5211] It is yet further appreciated that specific functions, and accordingly utilities, of GAM381 correlate with, and may be deduced from, the identity of the target genes which GAM381 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5212] Nucleotide sequences of the GAM381 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM381 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM381 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM381 are further described hereinbelow with reference to Table 1.

[5213] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM381 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5214] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 382 (GAM382) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5215] GAM382 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM382 was detected is described hereinabove with reference to Figs. 2-8.

[5216] GAM382 gene, herein designated GAM GENE, and GAM382 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5217] GAM382 gene, herein designated GAM GENE, encodes a GAM382 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM382 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM382 precursor RNA is designated SEQ ID:359, and is provided hereinbelow with reference to the sequence listing part.

[5218] GAM382 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM382 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5219] An enzyme complex designated DICER COMPLEX, dices the GAM382 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM382 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM382 RNA is designated SEQ ID:2959, and is provided hereinbelow with reference to the sequence listing part.

[5220] GAM382 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM382 target RNA, herein designated GAM TARGET RNA. GAM382 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5221] GAM382 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM382 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM382 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM382 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM382 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5222] The complementary binding of GAM382 RNA, herein designated GAM RNA, to target binding sites on GAM382 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM382 target RNA, herein designated GAM TARGET RNA, into GAM382 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5223] It is appreciated that GAM382 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM382 target genes. The mRNA of each one of this plurality of GAM382 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM382 RNA, herein designated GAM RNA, and which when bound by GAM382 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM382 target proteins.

[5224] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM382 gene, herein designated GAM GENE, on one or more GAM382 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5225] It is yet further appreciated that specific functions, and accordingly utilities, of GAM382 correlate with, and may be deduced from, the identity of the target genes which GAM382 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5226] Nucleotide sequences of the GAM382 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM382 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM382 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM382 are further described hereinbelow with reference to Table 1.

[5227] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM382 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5228] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 383 (GAM383) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5229] GAM383 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM383 was detected is described hereinabove with reference to Figs. 2-8.

[5230] GAM383 gene, herein designated GAM GENE, and GAM383 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5231] GAM383 gene, herein designated GAM GENE, encodes a GAM383 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM383 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM383 precursor RNA is designated SEQ ID:360, and is provided hereinbelow with reference to the sequence listing part.

[5232] GAM383 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM383 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5233] An enzyme complex designated DICER COMPLEX, dices the GAM383 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM383 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM383 RNA is designated SEQ ID:2960, and is provided hereinbelow with reference to the sequence listing part.

[5234] GAM383 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM383 target RNA, herein designated GAM TARGET RNA. GAM383 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5235] GAM383 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM383 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM383 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM383 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM383 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5236] The complementary binding of GAM383 RNA, herein designated GAM RNA, to target binding sites on GAM383 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM383 target RNA, herein designated GAM TARGET RNA, into GAM383 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5237] It is appreciated that GAM383 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM383 target genes. The mRNA of each one of this plurality of GAM383 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM383 RNA, herein designated GAM RNA, and which when bound by GAM383 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM383 target proteins.

[5238] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM383 gene, herein designated GAM GENE, on one or more

GAM383 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5239] It is yet further appreciated that specific functions, and accordingly utilities, of GAM383 correlate with, and may be deduced from, the identity of the target genes which GAM383 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5240] Nucleotide sequences of the GAM383 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM383 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM383 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM383 are further described hereinbelow with reference to Table 1.

[5241] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM383 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5242] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 384 (GAM384) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5243] GAM384 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM384 was detected is described hereinabove with reference to Figs. 2-8.

[5244] GAM384 gene, herein designated GAM GENE, and GAM384 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5245] GAM384 gene, herein designated GAM GENE, encodes a GAM384 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM384 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM384 precursor RNA is designated SEQ ID:361, and is provided hereinbelow with reference to the sequence listing part.

[5246] GAM384 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM384 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5247] An enzyme complex designated DICER COMPLEX, dices the GAM384 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM384 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM384 RNA is designated SEQ ID:2961, and is provided hereinbelow with reference to the sequence listing part.

[5248] GAM384 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM384 target RNA, herein designated GAM TARGET RNA. GAM384 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5249] GAM384 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM384 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM384 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM384 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM384 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5250] The complementary binding of GAM384 RNA, herein designated GAM RNA, to target binding sites on GAM384 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM384 target RNA, herein designated GAM TARGET RNA, into GAM384 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5251] It is appreciated that GAM384 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM384 target genes. The mRNA of each one of this plurality of GAM384 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM384 RNA, herein designated GAM RNA, and which when bound by GAM384 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM384 target proteins.

[5252] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM384 gene, herein designated GAM GENE, on one or more GAM384 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5253] It is yet further appreciated that specific functions, and accordingly utilities, of GAM384 correlate with, and may be deduced from, the identity of the target genes which GAM384 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5254] Nucleotide sequences of the GAM384 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM384 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM384 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM384 are further described hereinbelow with reference to Table 1.

[5255] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM384 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5256] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 385 (GAM385) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5257] GAM385 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM385 was detected is described hereinabove with reference to Figs. 2-8.

[5258] GAM385 gene, herein designated GAM GENE, and GAM385 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5259] GAM385 gene, herein designated GAM GENE, encodes a GAM385 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM385 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM385 precursor RNA is designated SEQ ID:362, and is provided hereinbelow with reference to the sequence listing part.

[5260] GAM385 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM385 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5261] An enzyme complex designated DICER COMPLEX, dices the GAM385 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM385 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM385 RNA is designated SEQ ID:2962, and is provided hereinbelow with reference to the sequence listing part.

[5262] GAM385 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM385 target RNA, herein designated GAM TARGET RNA. GAM385 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5263] GAM385 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM385

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM385 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM385 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM385 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5264] The complementary binding of GAM385 RNA, herein designated GAM RNA, to target binding sites on GAM385 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM385 target RNA, herein designated GAM TARGET RNA, into GAM385 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5265] It is appreciated that GAM385 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM385 target genes. The mRNA of each one of this plurality of GAM385 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM385 RNA, herein designated GAM RNA, and which when bound by GAM385 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM385 target proteins.

[5266] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM385 gene, herein designated GAM GENE, on one or more GAM385 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5267] It is yet further appreciated that specific functions, and accordingly utilities, of GAM385 correlate with, and may be deduced from, the identity of the target genes which GAM385 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5268] Nucleotide sequences of the GAM385 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM385 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM385 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM385 are further described hereinbelow with

reference to Table 1.

[5269] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM385 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5270] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 386 (GAM386) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5271] GAM386 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM386 was detected is described hereinabove with reference to Figs. 2-8.

[5272] GAM386 gene, herein designated GAM GENE, and GAM386 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5273] GAM386 gene, herein designated GAM GENE, encodes a GAM386 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM386 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM386 precursor RNA is designated SEQ ID:363, and is provided

hereinbelow with reference to the sequence listing part.

[5274] GAM386 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM386 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5275] An enzyme complex designated DICER COMPLEX, dices the GAM386 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM386 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM386 RNA is designated SEQ ID:2963, and is provided hereinbelow with reference to the sequence listing part.

[5276] GAM386 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM386 target RNA, herein designated GAM TARGET RNA. GAM386 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[5277] GAM386 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM386 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM386 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM386 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM386 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5278] The complementary binding of GAM386 RNA, herein designated GAM RNA, to target binding sites on GAM386 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM386 target RNA, herein designated GAM TARGET RNA, into GAM386 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5279] It is appreciated that GAM386 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM386 target genes. The mRNA of each one of this plurality of GAM386 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM386 RNA, herein designated GAM RNA, and which when bound by GAM386 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM386 target proteins.

[5280] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM386 gene, herein designated GAM GENE, on one or more GAM386 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5281] It is yet further appreciated that specific functions, and accordingly utilities, of GAM386 correlate with, and may be deduced from, the identity of the target genes which GAM386 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5282] Nucleotide sequences of the GAM386 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM386 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM386 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM386 are further described hereinbelow with reference to Table 1.

[5283] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM386 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5284] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 387 (GAM387) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5285] GAM387 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM387 was detected is described hereinabove with reference to Figs. 2-8.

[5286] GAM387 gene, herein designated GAM GENE, and GAM387 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5287] GAM387 gene, herein designated GAM GENE, encodes a GAM387 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM387 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM387 precursor RNA is designated SEQ ID:364, and is provided hereinbelow with reference to the sequence listing part.

[5288] GAM387 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM387 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5289] An enzyme complex designated DICER COMPLEX, dices the GAM387 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM387 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM387 RNA is designated SEQ ID:2964, and is provided hereinbelow with reference to the sequence listing part.

[5290] GAM387 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM387 target RNA, herein designated

GAM TARGET RNA. GAM387 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5291] GAM387 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM387 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM387 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM387 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM387 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5292] The complementary binding of GAM387 RNA, herein designated GAM RNA, to target binding sites on GAM387 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM387 target RNA, herein designated GAM

TARGET RNA, into GAM387 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5293] It is appreciated that GAM387 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM387 target genes. The mRNA of each one of this plurality of GAM387 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM387 RNA, herein designated GAM RNA, and which when bound by GAM387 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM387 target proteins.

[5294] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM387 gene, herein designated GAM GENE, on one or more GAM387 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5295] It is yet further appreciated that specific functions, and accordingly utilities, of GAM387 correlate with, and may be deduced from, the identity of the target

genes which GAM387 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5296] Nucleotide sequences of the GAM387 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM387 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM387 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM387 are further described hereinbelow with reference to Table 1.

[5297] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM387 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5298] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 388 (GAM388) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5299] GAM388 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM388 was detected is described hereinabove with reference to Figs. 2-8.

[5300] GAM388 gene, herein designated GAM GENE, and GAM388 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[5301] GAM388 gene, herein designated GAM GENE, encodes a GAM388 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM388 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM388 precursor RNA is designated SEQ ID:365, and is provided hereinbelow with reference to the sequence listing part.

[5302] GAM388 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5303] An enzyme complex designated DICER COMPLEX, dices the GAM388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM388 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM388 RNA is designated SEQ ID:2965, and is provided

hereinbelow with reference to the sequence listing part.

[5304] GAM388 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM388 target RNA, herein designated GAM TARGET RNA. GAM388 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5305] GAM388 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM388 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM388 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM388 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM388 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5306] The complementary binding of GAM388 RNA, herein designated GAM RNA, to target binding sites on GAM388 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM388 target RNA, herein designated GAM TARGET RNA, into GAM388 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5307] It is appreciated that GAM388 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM388 target genes. The mRNA of each one of this plurality of GAM388 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM388 RNA, herein designated GAM RNA, and which when bound by GAM388 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM388 target proteins.

[5308] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM388 gene, herein designated GAM GENE, on one or more GAM388 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5309] It is yet further appreciated that specific functions, and accordingly utilities, of GAM388 correlate with, and may be deduced from, the identity of the target genes which GAM388 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5310] Nucleotide sequences of the GAM388 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM388 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM388 are further described hereinbelow with reference to Table 1.

[5311] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM388 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5312] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 389 (GAM389) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5313] GAM389 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM389 was detected is

described hereinabove with reference to Figs. 2-8.

[5314] GAM389 gene, herein designated GAM GENE, and GAM389 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5315] GAM389 gene, herein designated GAM GENE, encodes a GAM389 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM389 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM389 precursor RNA is designated SEQ ID:366, and is provided hereinbelow with reference to the sequence listing part.

[5316] GAM389 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM389 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5317] An enzyme complex designated DICER COMPLEX, dices the GAM389 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM389 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM389 RNA is designated SEQ ID:2966, and is provided hereinbelow with reference to the sequence listing part.

[5318] GAM389 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM389 target RNA, herein designated GAM TARGET RNA. GAM389 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5319] GAM389 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM389 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM389 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM389 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM389 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5320] The complementary binding of GAM389 RNA, herein designated GAM RNA, to target binding sites on GAM389 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM389 target RNA, herein designated GAM TARGET RNA, into GAM389 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5321] It is appreciated that GAM389 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM389 target genes. The mRNA of each one of this plurality of GAM389 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM389 RNA, herein designated GAM RNA, and which when bound by GAM389 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM389 target proteins.

[5322] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM389 gene, herein designated GAM GENE, on one or more GAM389 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5323] It is yet further appreciated that specific functions, and accordingly utilities, of GAM389 correlate with, and may be deduced from, the identity of the target genes which GAM389 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5324] Nucleotide sequences of the GAM389 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM389 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM389 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM389 are further described hereinbelow with reference to Table 1.

[5325] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM389 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5326] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 390 (GAM390) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5327] GAM390 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM390 was detected is described hereinabove with reference to Figs. 2-8.

[5328] GAM390 gene, herein designated GAM GENE, and GAM390 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5329] GAM390 gene, herein designated GAM GENE, encodes a GAM390 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM390 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM390 precursor RNA is designated SEQ ID:367, and is provided hereinbelow with reference to the sequence listing part.

[5330] GAM390 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM390 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5331] An enzyme complex designated DICER COMPLEX, dices the GAM390 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM390 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM390 RNA is designated SEQ ID:2967, and is provided hereinbelow with reference to the sequence listing part.

[5332] GAM390 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM390 target RNA, herein designated GAM TARGET RNA. GAM390 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5333] GAM390 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM390 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM390 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM390 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM390 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5334] The complementary binding of GAM390 RNA, herein designated GAM RNA, to target binding sites on GAM390 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM390 target RNA, herein designated GAM TARGET RNA, into GAM390 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5335] It is appreciated that GAM390 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM390 target genes. The mRNA of each one of this plurality of GAM390 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM390 RNA, herein designated GAM RNA, and which when bound by GAM390 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM390 target proteins.

[5336] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM390 gene, herein designated GAM GENE, on one or more GAM390 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5337] It is yet further appreciated that specific functions, and accordingly utilities, of GAM390 correlate with, and may be deduced from, the identity of the target genes which GAM390 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5338] Nucleotide sequences of the GAM390 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM390 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM390 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM390 are further described hereinbelow with reference to Table 1.

[5339] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM390 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5340] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 391 (GAM391) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5341] GAM391 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM391 was detected is described hereinabove with reference to Figs. 2-8.

[5342] GAM391 gene, herein designated GAM GENE, and GAM391 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5343] GAM391 gene, herein designated GAM GENE, encodes a GAM391 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM391 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM391 precursor RNA is designated SEQ ID:368, and is provided hereinbelow with reference to the sequence listing part.

[5344] GAM391 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM391 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5345] An enzyme complex designated DICER COMPLEX, dices the GAM391 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM391 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM391 RNA is designated SEQ ID:2968, and is provided hereinbelow with reference to the sequence listing part.

[5346] GAM391 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM391 target RNA, herein designated GAM TARGET RNA. GAM391 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5347] GAM391 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM391 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM391 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM391 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM391 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5348] The complementary binding of GAM391 RNA, herein designated GAM RNA, to target binding sites on GAM391 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM391 target RNA, herein designated GAM TARGET RNA, into GAM391 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5349] It is appreciated that GAM391 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM391 target genes. The mRNA of each one of this plurality of GAM391 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM391 RNA, herein designated GAM RNA, and which when bound by GAM391 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM391 target proteins.

[5350] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM391 gene, herein designated GAM GENE, on one or more

GAM391 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5351] It is yet further appreciated that specific functions, and accordingly utilities, of GAM391 correlate with, and may be deduced from, the identity of the target genes which GAM391 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5352] Nucleotide sequences of the GAM391 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM391 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM391 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM391 are further described hereinbelow with reference to Table 1.

[5353] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM391 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5354] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 392 (GAM392) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5355] GAM392 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM392 was detected is described hereinabove with reference to Figs. 2-8.

[5356] GAM392 gene, herein designated GAM GENE, and GAM392 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5357] GAM392 gene, herein designated GAM GENE, encodes a GAM392 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM392 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM392 precursor RNA is designated SEQ ID:369, and is provided hereinbelow with reference to the sequence listing part.

[5358] GAM392 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM392 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5359] An enzyme complex designated DICER COMPLEX, dices the GAM392 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM392 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM392 RNA is designated SEQ ID:2969, and is provided hereinbelow with reference to the sequence listing part.

[5360] GAM392 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM392 target RNA, herein designated GAM TARGET RNA. GAM392 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5361] GAM392 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM392 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM392 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM392 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM392 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5362] The complementary binding of GAM392 RNA, herein designated GAM RNA, to target binding sites on GAM392 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM392 target RNA, herein designated GAM TARGET RNA, into GAM392 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5363] It is appreciated that GAM392 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM392 target genes. The mRNA of each one of this plurality of GAM392 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM392 RNA, herein designated GAM RNA, and which when bound by GAM392 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM392 target proteins.

[5364] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM392 gene, herein designated GAM GENE, on one or more GAM392 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5365] It is yet further appreciated that specific functions, and accordingly utilities, of GAM392 correlate with, and may be deduced from, the identity of the target genes which GAM392 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5366] Nucleotide sequences of the GAM392 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM392 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM392 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM392 are further described hereinbelow with reference to Table 1.

[5367] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM392 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5368] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 393 (GAM393) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5369] GAM393 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM393 was detected is described hereinabove with reference to Figs. 2-8.

[5370] GAM393 gene, herein designated GAM GENE, and GAM393 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5371] GAM393 gene, herein designated GAM GENE, encodes a GAM393 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM393 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM393 precursor RNA is designated SEQ ID:370, and is provided hereinbelow with reference to the sequence listing part.

[5372] GAM393 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM393 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5373] An enzyme complex designated DICER COMPLEX, dices the GAM393 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM393 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM393 RNA is designated SEQ ID:2970, and is provided hereinbelow with reference to the sequence listing part.

[5374] GAM393 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM393 target RNA, herein designated GAM TARGET RNA. GAM393 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5375] GAM393 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM393

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM393 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM393 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM393 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5376] The complementary binding of GAM393 RNA, herein designated GAM RNA, to target binding sites on GAM393 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM393 target RNA, herein designated GAM TARGET RNA, into GAM393 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5377] It is appreciated that GAM393 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM393 target genes. The mRNA of each one of this plurality of GAM393 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM393 RNA, herein designated GAM RNA, and which when bound by GAM393 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM393 target proteins.

[5378] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM393 gene, herein designated GAM GENE, on one or more GAM393 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5379] It is yet further appreciated that specific functions, and accordingly utilities, of GAM393 correlate with, and may be deduced from, the identity of the target genes which GAM393 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5380] Nucleotide sequences of the GAM393 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM393 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM393 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM393 are further described hereinbelow with

reference to Table 1.

[5381] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM393 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5382] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 394 (GAM394) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5383] GAM394 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM394 was detected is described hereinabove with reference to Figs. 2-8.

[5384] GAM394 gene, herein designated GAM GENE, and GAM394 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5385] GAM394 gene, herein designated GAM GENE, encodes a GAM394 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM394 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM394 precursor RNA is designated SEQ ID:371, and is provided

hereinbelow with reference to the sequence listing part.

[5386] GAM394 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM394 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5387] An enzyme complex designated DICER COMPLEX, dices the GAM394 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM394 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM394 RNA is designated SEQ ID:2971, and is provided hereinbelow with reference to the sequence listing part.

[5388] GAM394 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM394 target RNA, herein designated GAM TARGET RNA. GAM394 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[5389] GAM394 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM394 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM394 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM394 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM394 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5390] The complementary binding of GAM394 RNA, herein designated GAM RNA, to target binding sites on GAM394 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM394 target RNA, herein designated GAM TARGET RNA, into GAM394 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5391] It is appreciated that GAM394 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM394 target genes. The mRNA of each one of this plurality of GAM394 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM394 RNA, herein designated GAM RNA, and which when bound by GAM394 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM394 target proteins.

[5392] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM394 gene, herein designated GAM GENE, on one or more GAM394 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5393] It is yet further appreciated that specific functions, and accordingly utilities, of GAM394 correlate with, and may be deduced from, the identity of the target genes which GAM394 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5394] Nucleotide sequences of the GAM394 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM394 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM394 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM394 are further described hereinbelow with reference to Table 1.

[5395] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM394 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5396] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 395 (GAM395) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5397] GAM395 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM395 was detected is described hereinabove with reference to Figs. 2-8.

[5398] GAM395 gene, herein designated GAM GENE, and GAM395 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5399] GAM395 gene, herein designated GAM GENE, encodes a GAM395 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM395 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM395 precursor RNA is designated SEQ ID:372, and is provided hereinbelow with reference to the sequence listing part.

[5400] GAM395 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM395 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5401] An enzyme complex designated DICER COMPLEX, dices the GAM395 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM395 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM395 RNA is designated SEQ ID:2972, and is provided hereinbelow with reference to the sequence listing part.

[5402] GAM395 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM395 target RNA, herein designated

GAM TARGET RNA. GAM395 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5403] GAM395 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM395 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM395 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM395 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM395 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5404] The complementary binding of GAM395 RNA, herein designated GAM RNA, to target binding sites on GAM395 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM395 target RNA, herein designated GAM

TARGET RNA, into GAM395 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5405] It is appreciated that GAM395 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM395 target genes. The mRNA of each one of this plurality of GAM395 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM395 RNA, herein designated GAM RNA, and which when bound by GAM395 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM395 target proteins.

[5406] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM395 gene, herein designated GAM GENE, on one or more GAM395 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5407] It is yet further appreciated that specific functions, and accordingly utilities, of GAM395 correlate with, and may be deduced from, the identity of the target

genes which GAM395 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5408] Nucleotide sequences of the GAM395 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM395 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM395 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM395 are further described hereinbelow with reference to Table 1.

[5409] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM395 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5410] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 396 (GAM396) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5411] GAM396 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM396 was detected is described hereinabove with reference to Figs. 2-8.

[5412] GAM396 gene, herein designated GAM GENE, and GAM396 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[5413] GAM396 gene, herein designated GAM GENE, encodes a GAM396 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM396 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM396 precursor RNA is designated SEQ ID:373, and is provided hereinbelow with reference to the sequence listing part.

[5414] GAM396 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM396 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5415] An enzyme complex designated DICER COMPLEX, dices the GAM396 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM396 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM396 RNA is designated SEQ ID:2973, and is provided

hereinbelow with reference to the sequence listing part.

[5416] GAM396 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM396 target RNA, herein designated GAM TARGET RNA. GAM396 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5417] GAM396 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM396 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM396 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM396 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM396 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5418] The complementary binding of GAM396 RNA, herein designated GAM RNA, to target binding sites on GAM396 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM396 target RNA, herein designated GAM TARGET RNA, into GAM396 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5419] It is appreciated that GAM396 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM396 target genes. The mRNA of each one of this plurality of GAM396 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM396 RNA, herein designated GAM RNA, and which when bound by GAM396 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM396 target proteins.

[5420] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM396 gene, herein designated GAM GENE, on one or more GAM396 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5421] It is yet further appreciated that specific functions, and accordingly utilities, of GAM396 correlate with, and may be deduced from, the identity of the target genes which GAM396 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5422] Nucleotide sequences of the GAM396 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM396 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM396 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM396 are further described hereinbelow with reference to Table 1.

[5423] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM396 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5424] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 397 (GAM397) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5425] GAM397 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM397 was detected is

described hereinabove with reference to Figs. 2-8.

[5426] GAM397 gene, herein designated GAM GENE, and GAM397 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5427] GAM397 gene, herein designated GAM GENE, encodes a GAM397 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM397 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM397 precursor RNA is designated SEQ ID:374, and is provided hereinbelow with reference to the sequence listing part.

[5428] GAM397 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM397 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5429] An enzyme complex designated DICER COMPLEX, dices the GAM397 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM397 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM397 RNA is designated SEQ ID:2974, and is provided hereinbelow with reference to the sequence listing part.

[5430] GAM397 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM397 target RNA, herein designated GAM TARGET RNA. GAM397 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5431] GAM397 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM397 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM397 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM397 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM397 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5432] The complementary binding of GAM397 RNA, herein designated GAM RNA, to target binding sites on GAM397 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM397 target RNA, herein designated GAM TARGET RNA, into GAM397 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5433] It is appreciated that GAM397 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM397 target genes. The mRNA of each one of this plurality of GAM397 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM397 RNA, herein designated GAM RNA, and which when bound by GAM397 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM397 target proteins.

[5434] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM397 gene, herein designated GAM GENE, on one or more GAM397 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5435] It is yet further appreciated that specific functions, and accordingly utilities, of GAM397 correlate with, and may be deduced from, the identity of the target genes which GAM397 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5436] Nucleotide sequences of the GAM397 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM397 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM397 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM397 are further described hereinbelow with reference to Table 1.

[5437] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM397 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5438] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 398 (GAM398) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5439] GAM398 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM398 was detected is described hereinabove with reference to Figs. 2-8.

[5440] GAM398 gene, herein designated GAM GENE, and GAM398 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5441] GAM398 gene, herein designated GAM GENE, encodes a GAM398 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM398 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM398 precursor RNA is designated SEQ ID:375, and is provided hereinbelow with reference to the sequence listing part.

[5442] GAM398 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM398 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5443] An enzyme complex designated DICER COMPLEX, dices the GAM398 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM398 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM398 RNA is designated SEQ ID:2975, and is provided hereinbelow with reference to the sequence listing part.

[5444] GAM398 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM398 target RNA, herein designated GAM TARGET RNA. GAM398 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5445] GAM398 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM398 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM398 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM398 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM398 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5446] The complementary binding of GAM398 RNA, herein designated GAM RNA, to target binding sites on GAM398 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM398 target RNA, herein designated GAM TARGET RNA, into GAM398 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5447] It is appreciated that GAM398 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM398 target genes. The mRNA of each one of this plurality of GAM398 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM398 RNA, herein designated GAM RNA, and which when bound by GAM398 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM398 target proteins.

[5448] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM398 gene, herein designated GAM GENE, on one or more GAM398 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5449] It is yet further appreciated that specific functions, and accordingly utilities, of GAM398 correlate with, and may be deduced from, the identity of the target genes which GAM398 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5450] Nucleotide sequences of the GAM398 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM398 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM398 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM398 are further described hereinbelow with reference to Table 1.

[5451] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM398 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5452] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 399 (GAM399) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5453] GAM399 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM399 was detected is described hereinabove with reference to Figs. 2-8.

[5454] GAM399 gene, herein designated GAM GENE, and GAM399 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5455] GAM399 gene, herein designated GAM GENE, encodes a GAM399 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM399 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM399 precursor RNA is designated SEQ ID:376, and is provided hereinbelow with reference to the sequence listing part.

[5456] GAM399 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM399 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5457] An enzyme complex designated DICER COMPLEX, dices the GAM399 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM399 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM399 RNA is designated SEQ ID:2976, and is provided hereinbelow with reference to the sequence listing part.

[5458] GAM399 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM399 target RNA, herein designated GAM TARGET RNA. GAM399 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5459] GAM399 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM399 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM399 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM399 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM399 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5460] The complementary binding of GAM399 RNA, herein designated GAM RNA, to target binding sites on GAM399 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM399 target RNA, herein designated GAM TARGET RNA, into GAM399 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5461] It is appreciated that GAM399 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM399 target genes. The mRNA of each one of this plurality of GAM399 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM399 RNA, herein designated GAM RNA, and which when bound by GAM399 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM399 target proteins.

[5462] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM399 gene, herein designated GAM GENE, on one or more

GAM399 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5463] It is yet further appreciated that specific functions, and accordingly utilities, of GAM399 correlate with, and may be deduced from, the identity of the target genes which GAM399 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5464] Nucleotide sequences of the GAM399 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM399 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM399 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM399 are further described hereinbelow with reference to Table 1.

[5465] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM399 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5466] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 400 (GAM400) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5467] GAM400 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM400 was detected is described hereinabove with reference to Figs. 2-8.

[5468] GAM400 gene, herein designated GAM GENE, and GAM400 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5469] GAM400 gene, herein designated GAM GENE, encodes a GAM400 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM400 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM400 precursor RNA is designated SEQ ID:377, and is provided hereinbelow with reference to the sequence listing part.

[5470] GAM400 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM400 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5471] An enzyme complex designated DICER COMPLEX, dices the GAM400 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM400 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM400 RNA is designated SEQ ID:2977, and is provided hereinbelow with reference to the sequence listing part.

[5472] GAM400 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM400 target RNA, herein designated GAM TARGET RNA. GAM400 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5473] GAM400 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM400 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM400 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM400 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM400 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5474] The complementary binding of GAM400 RNA, herein designated GAM RNA, to target binding sites on GAM400 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM400 target RNA, herein designated GAM TARGET RNA, into GAM400 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5475] It is appreciated that GAM400 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM400 target genes. The mRNA of each one of this plurality of GAM400 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM400 RNA, herein designated GAM RNA, and which when bound by GAM400 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM400 target proteins.

[5476] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM400 gene, herein designated GAM GENE, on one or more GAM400 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5477] It is yet further appreciated that specific functions, and accordingly utilities, of GAM400 correlate with, and may be deduced from, the identity of the target genes which GAM400 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5478] Nucleotide sequences of the GAM400 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM400 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM400 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM400 are further described hereinbelow with reference to Table 1.

[5479] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM400 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5480] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 401 (GAM401) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5481] GAM401 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM401 was detected is described hereinabove with reference to Figs. 2-8.

[5482] GAM401 gene, herein designated GAM GENE, and GAM401 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5483] GAM401 gene, herein designated GAM GENE, encodes a GAM401 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM401 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM401 precursor RNA is designated SEQ ID:378, and is provided hereinbelow with reference to the sequence listing part.

[5484] GAM401 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM401 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5485] An enzyme complex designated DICER COMPLEX, dices the GAM401 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM401 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM401 RNA is designated SEQ ID:2979, and is provided hereinbelow with reference to the sequence listing part.

[5486] GAM401 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM401 target RNA, herein designated GAM TARGET RNA. GAM401 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5487] GAM401 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM401

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM401 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM401 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM401 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5488] The complementary binding of GAM401 RNA, herein designated GAM RNA, to target binding sites on GAM401 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM401 target RNA, herein designated GAM TARGET RNA, into GAM401 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5489] It is appreciated that GAM401 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM401 target genes. The mRNA of each one of this plurality of GAM401 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM401 RNA, herein designated GAM RNA, and which when bound by GAM401 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM401 target proteins.

[5490] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM401 gene, herein designated GAM GENE, on one or more GAM401 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5491] It is yet further appreciated that specific functions, and accordingly utilities, of GAM401 correlate with, and may be deduced from, the identity of the target genes which GAM401 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5492] Nucleotide sequences of the GAM401 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM401 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM401 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM401 are further described hereinbelow with

reference to Table 1.

[5493] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM401 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5494] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 402 (GAM402) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5495] GAM402 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM402 was detected is described hereinabove with reference to Figs. 2-8.

[5496] GAM402 gene, herein designated GAM GENE, and GAM402 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5497] GAM402 gene, herein designated GAM GENE, encodes a GAM402 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM402 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM402 precursor RNA is designated SEQ ID:379, and is provided

hereinbelow with reference to the sequence listing part.

[5498] GAM402 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM402 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5499] An enzyme complex designated DICER COMPLEX, dices the GAM402 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM402 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM402 RNA is designated SEQ ID:2978, and is provided hereinbelow with reference to the sequence listing part.

[5500] GAM402 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM402 target RNA, herein designated GAM TARGET RNA. GAM402 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[5501] GAM402 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM402 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM402 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM402 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM402 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5502] The complementary binding of GAM402 RNA, herein designated GAM RNA, to target binding sites on GAM402 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM402 target RNA, herein designated GAM TARGET RNA, into GAM402 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5503] It is appreciated that GAM402 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM402 target genes. The mRNA of each one of this plurality of GAM402 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM402 RNA, herein designated GAM RNA, and which when bound by GAM402 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM402 target proteins.

[5504] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM402 gene, herein designated GAM GENE, on one or more GAM402 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5505] It is yet further appreciated that specific functions, and accordingly utilities, of GAM402 correlate with, and may be deduced from, the identity of the target genes which GAM402 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5506] Nucleotide sequences of the GAM402 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM402 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM402 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM402 are further described hereinbelow with reference to Table 1.

[5507] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM402 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5508] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 403 (GAM403) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5509] GAM403 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM403 was detected is described hereinabove with reference to Figs. 2-8.

[5510] GAM403 gene, herein designated GAM GENE, and GAM403 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5511] GAM403 gene, herein designated GAM GENE, encodes a GAM403 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM403 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM403 precursor RNA is designated SEQ ID:380, and is provided hereinbelow with reference to the sequence listing part.

[5512] GAM403 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM403 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5513] An enzyme complex designated DICER COMPLEX, dices the GAM403 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM403 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM403 RNA is designated SEQ ID:2980, and is provided hereinbelow with reference to the sequence listing part.

[5514] GAM403 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM403 target RNA, herein designated

GAM TARGET RNA. GAM403 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5515] GAM403 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM403 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM403 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM403 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM403 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5516] The complementary binding of GAM403 RNA, herein designated GAM RNA, to target binding sites on GAM403 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM403 target RNA, herein designated GAM

TARGET RNA, into GAM403 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5517] It is appreciated that GAM403 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM403 target genes. The mRNA of each one of this plurality of GAM403 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM403 RNA, herein designated GAM RNA, and which when bound by GAM403 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM403 target proteins.

[5518] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM403 gene, herein designated GAM GENE, on one or more GAM403 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5519] It is yet further appreciated that specific functions, and accordingly utilities, of GAM403 correlate with, and may be deduced from, the identity of the target

genes which GAM403 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5520] Nucleotide sequences of the GAM403 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM403 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM403 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM403 are further described hereinbelow with reference to Table 1.

[5521] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM403 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5522] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 404 (GAM404) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5523] GAM404 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM404 was detected is described hereinabove with reference to Figs. 2-8.

[5524] GAM404 gene, herein designated GAM GENE, and GAM404 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[5525] GAM404 gene, herein designated GAM GENE, encodes a GAM404 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM404 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM404 precursor RNA is designated SEQ ID:381, and is provided hereinbelow with reference to the sequence listing part.

[5526] GAM404 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM404 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5527] An enzyme complex designated DICER COMPLEX, dices the GAM404 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM404 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM404 RNA is designated SEQ ID:2981, and is provided

hereinbelow with reference to the sequence listing part.

[5528] GAM404 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM404 target RNA, herein designated GAM TARGET RNA. GAM404 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5529] GAM404 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM404 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM404 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM404 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM404 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5530] The complementary binding of GAM404 RNA, herein designated GAM RNA, to target binding sites on GAM404 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM404 target RNA, herein designated GAM TARGET RNA, into GAM404 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5531] It is appreciated that GAM404 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM404 target genes. The mRNA of each one of this plurality of GAM404 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM404 RNA, herein designated GAM RNA, and which when bound by GAM404 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM404 target proteins.

[5532] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM404 gene, herein designated GAM GENE, on one or more GAM404 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5533] It is yet further appreciated that specific functions, and accordingly utilities, of GAM404 correlate with, and may be deduced from, the identity of the target genes which GAM404 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5534] Nucleotide sequences of the GAM404 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM404 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM404 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM404 are further described hereinbelow with reference to Table 1.

[5535] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM404 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5536] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 405 (GAM405) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5537] GAM405 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM405 was detected is

described hereinabove with reference to Figs. 2-8.

[5538] GAM405 gene, herein designated GAM GENE, and GAM405 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5539] GAM405 gene, herein designated GAM GENE, encodes a GAM405 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM405 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM405 precursor RNA is designated SEQ ID:382, and is provided hereinbelow with reference to the sequence listing part.

[5540] GAM405 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM405 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5541] An enzyme complex designated DICER COMPLEX, dices the GAM405 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM405 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM405 RNA is designated SEQ ID:2982, and is provided hereinbelow with reference to the sequence listing part.

[5542] GAM405 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM405 target RNA, herein designated GAM TARGET RNA. GAM405 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5543] GAM405 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM405 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM405 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM405 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM405 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5544] The complementary binding of GAM405 RNA, herein designated GAM RNA, to target binding sites on GAM405 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM405 target RNA, herein designated GAM TARGET RNA, into GAM405 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5545] It is appreciated that GAM405 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM405 target genes. The mRNA of each one of this plurality of GAM405 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM405 RNA, herein designated GAM RNA, and which when bound by GAM405 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM405 target proteins.

[5546] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM405 gene, herein designated GAM GENE, on one or more GAM405 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5547] It is yet further appreciated that specific functions, and accordingly utilities, of GAM405 correlate with, and may be deduced from, the identity of the target genes which GAM405 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5548] Nucleotide sequences of the GAM405 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM405 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM405 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM405 are further described hereinbelow with reference to Table 1.

[5549] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM405 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5550] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 406 (GAM406) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5551] GAM406 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM406 was detected is described hereinabove with reference to Figs. 2-8.

[5552] GAM406 gene, herein designated GAM GENE, and GAM406 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5553] GAM406 gene, herein designated GAM GENE, encodes a GAM406 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM406 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM406 precursor RNA is designated SEQ ID:383, and is provided hereinbelow with reference to the sequence listing part.

[5554] GAM406 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM406 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5555] An enzyme complex designated DICER COMPLEX, dices the GAM406 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM406 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM406 RNA is designated SEQ ID:2983, and is provided hereinbelow with reference to the sequence listing part.

[5556] GAM406 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM406 target RNA, herein designated GAM TARGET RNA. GAM406 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5557] GAM406 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM406 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM406 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM406 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM406 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5558] The complementary binding of GAM406 RNA, herein designated GAM RNA, to target binding sites on GAM406 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM406 target RNA, herein designated GAM TARGET RNA, into GAM406 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5559] It is appreciated that GAM406 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM406 target genes. The mRNA of each one of this plurality of GAM406 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM406 RNA, herein designated GAM RNA, and which when bound by GAM406 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM406 target proteins.

[5560] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM406 gene, herein designated GAM GENE, on one or more GAM406 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5561] It is yet further appreciated that specific functions, and accordingly utilities, of GAM406 correlate with, and may be deduced from, the identity of the target genes which GAM406 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5562] Nucleotide sequences of the GAM406 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM406 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM406 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM406 are further described hereinbelow with reference to Table 1.

[5563] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM406 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5564] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 407 (GAM407) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5565] GAM407 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM407 was detected is described hereinabove with reference to Figs. 2-8.

[5566] GAM407 gene, herein designated GAM GENE, and GAM407 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5567] GAM407 gene, herein designated GAM GENE, encodes a GAM407 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM407 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM407 precursor RNA is designated SEQ ID:384, and is provided hereinbelow with reference to the sequence listing part.

[5568] GAM407 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM407 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5569] An enzyme complex designated DICER COMPLEX, dices the GAM407 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM407 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM407 RNA is designated SEQ ID:2985, and is provided hereinbelow with reference to the sequence listing part.

[5570] GAM407 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM407 target RNA, herein designated GAM TARGET RNA. GAM407 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5571] GAM407 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM407 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM407 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM407 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM407 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5572] The complementary binding of GAM407 RNA, herein designated GAM RNA, to target binding sites on GAM407 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM407 target RNA, herein designated GAM TARGET RNA, into GAM407 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5573] It is appreciated that GAM407 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM407 target genes. The mRNA of each one of this plurality of GAM407 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM407 RNA, herein designated GAM RNA, and which when bound by GAM407 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM407 target proteins.

[5574] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM407 gene, herein designated GAM GENE, on one or more

GAM407 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5575] It is yet further appreciated that specific functions, and accordingly utilities, of GAM407 correlate with, and may be deduced from, the identity of the target genes which GAM407 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5576] Nucleotide sequences of the GAM407 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM407 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM407 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM407 are further described hereinbelow with reference to Table 1.

[5577] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM407 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5578] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 408 (GAM408) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5579] GAM408 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM408 was detected is described hereinabove with reference to Figs. 2-8.

[5580] GAM408 gene, herein designated GAM GENE, and GAM408 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5581] GAM408 gene, herein designated GAM GENE, encodes a GAM408 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM408 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM408 precursor RNA is designated SEQ ID:385, and is provided hereinbelow with reference to the sequence listing part.

[5582] GAM408 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5583] An enzyme complex designated DICER COMPLEX, dices the GAM408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM408 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM408 RNA is designated SEQ ID:2984, and is provided hereinbelow with reference to the sequence listing part.

[5584] GAM408 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM408 target RNA, herein designated GAM TARGET RNA. GAM408 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5585] GAM408 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM408 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM408 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM408 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM408 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5586] The complementary binding of GAM408 RNA, herein designated GAM RNA, to target binding sites on GAM408 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM408 target RNA, herein designated GAM TARGET RNA, into GAM408 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5587] It is appreciated that GAM408 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM408 target genes. The mRNA of each one of this plurality of GAM408 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM408 RNA, herein designated GAM RNA, and which when bound by GAM408 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM408 target proteins.

[5588] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM408 gene, herein designated GAM GENE, on one or more GAM408 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5589] It is yet further appreciated that specific functions, and accordingly utilities, of GAM408 correlate with, and may be deduced from, the identity of the target genes which GAM408 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5590] Nucleotide sequences of the GAM408 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM408 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM408 are further described hereinbelow with reference to Table 1.

[5591] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM408 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5592] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 409 (GAM409) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5593] GAM409 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM409 was detected is described hereinabove with reference to Figs. 2-8.

[5594] GAM409 gene, herein designated GAM GENE, and GAM409 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5595] GAM409 gene, herein designated GAM GENE, encodes a GAM409 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM409 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM409 precursor RNA is designated SEQ ID:386, and is provided hereinbelow with reference to the sequence listing part.

[5596] GAM409 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM409 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5597] An enzyme complex designated DICER COMPLEX, dices the GAM409 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM409 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM409 RNA is designated SEQ ID:2986, and is provided hereinbelow with reference to the sequence listing part.

[5598] GAM409 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM409 target RNA, herein designated GAM TARGET RNA. GAM409 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5599] GAM409 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM409

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM409 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM409 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM409 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5600] The complementary binding of GAM409 RNA, herein designated GAM RNA, to target binding sites on GAM409 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM409 target RNA, herein designated GAM TARGET RNA, into GAM409 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5601] It is appreciated that GAM409 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM409 target genes. The mRNA of each one of this plurality of GAM409 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM409 RNA, herein designated GAM RNA, and which when bound by GAM409 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM409 target proteins.

[5602] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM409 gene, herein designated GAM GENE, on one or more GAM409 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5603] It is yet further appreciated that specific functions, and accordingly utilities, of GAM409 correlate with, and may be deduced from, the identity of the target genes which GAM409 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5604] Nucleotide sequences of the GAM409 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM409 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM409 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM409 are further described hereinbelow with

reference to Table 1.

[5605] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM409 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5606] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 410 (GAM410) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5607] GAM410 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM410 was detected is described hereinabove with reference to Figs. 2-8.

[5608] GAM410 gene, herein designated GAM GENE, and GAM410 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5609] GAM410 gene, herein designated GAM GENE, encodes a GAM410 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM410 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM410 precursor RNA is designated SEQ ID:387, and is provided

hereinbelow with reference to the sequence listing part.

[5610] GAM410 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM410 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5611] An enzyme complex designated DICER COMPLEX, dices the GAM410 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM410 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM410 RNA is designated SEQ ID:2987, and is provided hereinbelow with reference to the sequence listing part.

[5612] GAM410 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM410 target RNA, herein designated GAM TARGET RNA. GAM410 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[5613] GAM410 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM410 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM410 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM410 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM410 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5614] The complementary binding of GAM410 RNA, herein designated GAM RNA, to target binding sites on GAM410 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM410 target RNA, herein designated GAM TARGET RNA, into GAM410 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5615] It is appreciated that GAM410 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM410 target genes. The mRNA of each one of this plurality of GAM410 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM410 RNA, herein designated GAM RNA, and which when bound by GAM410 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM410 target proteins.

[5616] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM410 gene, herein designated GAM GENE, on one or more GAM410 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5617] It is yet further appreciated that specific functions, and accordingly utilities, of GAM410 correlate with, and may be deduced from, the identity of the target genes which GAM410 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5618] Nucleotide sequences of the GAM410 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM410 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM410 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM410 are further described hereinbelow with reference to Table 1.

[5619] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM410 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5620] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 411 (GAM411) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5621] GAM411 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM411 was detected is described hereinabove with reference to Figs. 2-8.

[5622] GAM411 gene, herein designated GAM GENE, and GAM411 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5623] GAM411 gene, herein designated GAM GENE, encodes a GAM411 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM411 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM411 precursor RNA is designated SEQ ID:388, and is provided hereinbelow with reference to the sequence listing part.

[5624] GAM411 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM411 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5625] An enzyme complex designated DICER COMPLEX, dices the GAM411 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM411 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM411 RNA is designated SEQ ID:2988, and is provided hereinbelow with reference to the sequence listing part.

[5626] GAM411 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM411 target RNA, herein designated

GAM TARGET RNA. GAM411 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5627] GAM411 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM411 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM411 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM411 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM411 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5628] The complementary binding of GAM411 RNA, herein designated GAM RNA, to target binding sites on GAM411 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM411 target RNA, herein designated GAM

TARGET RNA, into GAM411 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5629] It is appreciated that GAM411 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM411 target genes. The mRNA of each one of this plurality of GAM411 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM411 RNA, herein designated GAM RNA, and which when bound by GAM411 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM411 target proteins.

[5630] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM411 gene, herein designated GAM GENE, on one or more GAM411 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5631] It is yet further appreciated that specific functions, and accordingly utilities, of GAM411 correlate with, and may be deduced from, the identity of the target

genes which GAM411 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5632] Nucleotide sequences of the GAM411 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM411 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM411 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM411 are further described hereinbelow with reference to Table 1.

[5633] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM411 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5634] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 412 (GAM412) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5635] GAM412 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM412 was detected is described hereinabove with reference to Figs. 2-8.

[5636] GAM412 gene, herein designated GAM GENE, and GAM412 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[5637] GAM412 gene, herein designated GAM GENE, encodes a GAM412 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM412 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM412 precursor RNA is designated SEQ ID:389, and is provided hereinbelow with reference to the sequence listing part.

[5638] GAM412 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM412 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5639] An enzyme complex designated DICER COMPLEX, dices the GAM412 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM412 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM412 RNA is designated SEQ ID:2989, and is provided

hereinbelow with reference to the sequence listing part.

[5640] GAM412 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM412 target RNA, herein designated GAM TARGET RNA. GAM412 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5641] GAM412 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM412 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM412 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM412 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM412 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5642] The complementary binding of GAM412 RNA, herein designated GAM RNA, to target binding sites on GAM412 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM412 target RNA, herein designated GAM TARGET RNA, into GAM412 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5643] It is appreciated that GAM412 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM412 target genes. The mRNA of each one of this plurality of GAM412 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM412 RNA, herein designated GAM RNA, and which when bound by GAM412 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM412 target proteins.

[5644] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM412 gene, herein designated GAM GENE, on one or more GAM412 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5645] It is yet further appreciated that specific functions, and accordingly utilities, of GAM412 correlate with, and may be deduced from, the identity of the target genes which GAM412 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5646] Nucleotide sequences of the GAM412 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM412 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM412 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM412 are further described hereinbelow with reference to Table 1.

[5647] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM412 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5648] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 413 (GAM413) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5649] GAM413 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM413 was detected is

described hereinabove with reference to Figs. 2-8.

[5650] GAM413 gene, herein designated GAM GENE, and GAM413 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5651] GAM413 gene, herein designated GAM GENE, encodes a GAM413 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM413 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM413 precursor RNA is designated SEQ ID:390, and is provided hereinbelow with reference to the sequence listing part.

[5652] GAM413 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM413 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5653] An enzyme complex designated DICER COMPLEX, dices the GAM413 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM413 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM413 RNA is designated SEQ ID:2991, and is provided hereinbelow with reference to the sequence listing part.

[5654] GAM413 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM413 target RNA, herein designated GAM TARGET RNA. GAM413 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5655] GAM413 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM413 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM413 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM413 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM413 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5656] The complementary binding of GAM413 RNA, herein designated GAM RNA, to target binding sites on GAM413 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM413 target RNA, herein designated GAM TARGET RNA, into GAM413 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5657] It is appreciated that GAM413 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM413 target genes. The mRNA of each one of this plurality of GAM413 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM413 RNA, herein designated GAM RNA, and which when bound by GAM413 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM413 target proteins.

[5658] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM413 gene, herein designated GAM GENE, on one or more GAM413 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5659] It is yet further appreciated that specific functions, and accordingly utilities, of GAM413 correlate with, and may be deduced from, the identity of the target genes which GAM413 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5660] Nucleotide sequences of the GAM413 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM413 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM413 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM413 are further described hereinbelow with reference to Table 1.

[5661] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM413 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5662] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 414 (GAM414) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5663] GAM414 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM414 was detected is described hereinabove with reference to Figs. 2-8.

[5664] GAM414 gene, herein designated GAM GENE, and GAM414 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5665] GAM414 gene, herein designated GAM GENE, encodes a GAM414 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM414 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM414 precursor RNA is designated SEQ ID:391, and is provided hereinbelow with reference to the sequence listing part.

[5666] GAM414 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM414 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5667] An enzyme complex designated DICER COMPLEX, dices the GAM414 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM414 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM414 RNA is designated SEQ ID:2990, and is provided hereinbelow with reference to the sequence listing part.

[5668] GAM414 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM414 target RNA, herein designated GAM TARGET RNA. GAM414 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5669] GAM414 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM414 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM414 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM414 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM414 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5670] The complementary binding of GAM414 RNA, herein designated GAM RNA, to target binding sites on GAM414 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM414 target RNA, herein designated GAM TARGET RNA, into GAM414 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5671] It is appreciated that GAM414 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM414 target genes. The mRNA of each one of this plurality of GAM414 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM414 RNA, herein designated GAM RNA, and which when bound by GAM414 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM414 target proteins.

[5672] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM414 gene, herein designated GAM GENE, on one or more GAM414 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5673] It is yet further appreciated that specific functions, and accordingly utilities, of GAM414 correlate with, and may be deduced from, the identity of the target genes which GAM414 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5674] Nucleotide sequences of the GAM414 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM414 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM414 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM414 are further described hereinbelow with reference to Table 1.

[5675] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM414 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5676] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 415 (GAM415) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5677] GAM415 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM415 was detected is described hereinabove with reference to Figs. 2-8.

[5678] GAM415 gene, herein designated GAM GENE, and GAM415 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5679] GAM415 gene, herein designated GAM GENE, encodes a GAM415 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM415 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM415 precursor RNA is designated SEQ ID:392, and is provided hereinbelow with reference to the sequence listing part.

[5680] GAM415 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM415 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5681] An enzyme complex designated DICER COMPLEX, dices the GAM415 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM415 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM415 RNA is designated SEQ ID:2992, and is provided hereinbelow with reference to the sequence listing part.

[5682] GAM415 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM415 target RNA, herein designated GAM TARGET RNA. GAM415 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5683] GAM415 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM415 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM415 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM415 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM415 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5684] The complementary binding of GAM415 RNA, herein designated GAM RNA, to target binding sites on GAM415 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM415 target RNA, herein designated GAM TARGET RNA, into GAM415 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5685] It is appreciated that GAM415 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM415 target genes. The mRNA of each one of this plurality of GAM415 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM415 RNA, herein designated GAM RNA, and which when bound by GAM415 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM415 target proteins.

[5686] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM415 gene, herein designated GAM GENE, on one or more

GAM415 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5687] It is yet further appreciated that specific functions, and accordingly utilities, of GAM415 correlate with, and may be deduced from, the identity of the target genes which GAM415 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5688] Nucleotide sequences of the GAM415 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM415 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM415 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM415 are further described hereinbelow with reference to Table 1.

[5689] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM415 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5690] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 416 (GAM416) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5691] GAM416 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM416 was detected is described hereinabove with reference to Figs. 2-8.

[5692] GAM416 gene, herein designated GAM GENE, and GAM416 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5693] GAM416 gene, herein designated GAM GENE, encodes a GAM416 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM416 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM416 precursor RNA is designated SEQ ID:393, and is provided hereinbelow with reference to the sequence listing part.

[5694] GAM416 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM416 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5695] An enzyme complex designated DICER COMPLEX, dices the GAM416 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM416 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM416 RNA is designated SEQ ID:2993, and is provided hereinbelow with reference to the sequence listing part.

[5696] GAM416 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM416 target RNA, herein designated GAM TARGET RNA. GAM416 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5697] GAM416 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM416 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM416 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM416 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM416 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5698] The complementary binding of GAM416 RNA, herein designated GAM RNA, to target binding sites on GAM416 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM416 target RNA, herein designated GAM TARGET RNA, into GAM416 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5699] It is appreciated that GAM416 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM416 target genes. The mRNA of each one of this plurality of GAM416 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM416 RNA, herein designated GAM RNA, and which when bound by GAM416 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM416 target proteins.

[5700] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM416 gene, herein designated GAM GENE, on one or more GAM416 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5701] It is yet further appreciated that specific functions, and accordingly utilities, of GAM416 correlate with, and may be deduced from, the identity of the target genes which GAM416 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5702] Nucleotide sequences of the GAM416 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM416 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM416 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM416 are further described hereinbelow with reference to Table 1.

[5703] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM416 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5704] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 417 (GAM417) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5705] GAM417 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM417 was detected is described hereinabove with reference to Figs. 2-8.

[5706] GAM417 gene, herein designated GAM GENE, and GAM417 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5707] GAM417 gene, herein designated GAM GENE, encodes a GAM417 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM417 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM417 precursor RNA is designated SEQ ID:394, and is provided hereinbelow with reference to the sequence listing part.

[5708] GAM417 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM417 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5709] An enzyme complex designated DICER COMPLEX, dices the GAM417 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM417 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM417 RNA is designated SEQ ID:2994, and is provided hereinbelow with reference to the sequence listing part.

[5710] GAM417 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM417 target RNA, herein designated GAM TARGET RNA. GAM417 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5711] GAM417 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM417

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM417 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM417 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM417 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5712] The complementary binding of GAM417 RNA, herein designated GAM RNA, to target binding sites on GAM417 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM417 target RNA, herein designated GAM TARGET RNA, into GAM417 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5713] It is appreciated that GAM417 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM417 target genes. The mRNA of each one of this plurality of GAM417 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM417 RNA, herein designated GAM RNA, and which when bound by GAM417 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM417 target proteins.

[5714] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM417 gene, herein designated GAM GENE, on one or more GAM417 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5715] It is yet further appreciated that specific functions, and accordingly utilities, of GAM417 correlate with, and may be deduced from, the identity of the target genes which GAM417 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5716] Nucleotide sequences of the GAM417 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM417 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM417 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM417 are further described hereinbelow with

reference to Table 1.

[5717] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM417 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5718] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 418 (GAM418) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5719] GAM418 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM418 was detected is described hereinabove with reference to Figs. 2-8.

[5720] GAM418 gene, herein designated GAM GENE, and GAM418 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5721] GAM418 gene, herein designated GAM GENE, encodes a GAM418 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM418 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM418 precursor RNA is designated SEQ ID:395, and is provided

hereinbelow with reference to the sequence listing part.

[5722] GAM418 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM418 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5723] An enzyme complex designated DICER COMPLEX, dices the GAM418 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM418 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM418 RNA is designated SEQ ID:2995, and is provided hereinbelow with reference to the sequence listing part.

[5724] GAM418 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM418 target RNA, herein designated GAM TARGET RNA. GAM418 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[5725] GAM418 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM418 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM418 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM418 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM418 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5726] The complementary binding of GAM418 RNA, herein designated GAM RNA, to target binding sites on GAM418 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM418 target RNA, herein designated GAM TARGET RNA, into GAM418 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5727] It is appreciated that GAM418 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM418 target genes. The mRNA of each one of this plurality of GAM418 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM418 RNA, herein designated GAM RNA, and which when bound by GAM418 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM418 target proteins.

[5728] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM418 gene, herein designated GAM GENE, on one or more GAM418 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5729] It is yet further appreciated that specific functions, and accordingly utilities, of GAM418 correlate with, and may be deduced from, the identity of the target genes which GAM418 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5730] Nucleotide sequences of the GAM418 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM418 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM418 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM418 are further described hereinbelow with reference to Table 1.

[5731] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM418 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5732] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 419 (GAM419) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5733] GAM419 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM419 was detected is described hereinabove with reference to Figs. 2-8.

[5734] GAM419 gene, herein designated GAM GENE, and GAM419 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5735] GAM419 gene, herein designated GAM GENE, encodes a GAM419 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM419 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM419 precursor RNA is designated SEQ ID:396, and is provided hereinbelow with reference to the sequence listing part.

[5736] GAM419 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM419 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5737] An enzyme complex designated DICER COMPLEX, dices the GAM419 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM419 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM419 RNA is designated SEQ ID:2996, and is provided hereinbelow with reference to the sequence listing part.

[5738] GAM419 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM419 target RNA, herein designated

GAM TARGET RNA. GAM419 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5739] GAM419 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM419 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM419 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM419 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM419 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5740] The complementary binding of GAM419 RNA, herein designated GAM RNA, to target binding sites on GAM419 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM419 target RNA, herein designated GAM

TARGET RNA, into GAM419 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5741] It is appreciated that GAM419 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM419 target genes. The mRNA of each one of this plurality of GAM419 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM419 RNA, herein designated GAM RNA, and which when bound by GAM419 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM419 target proteins.

[5742] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM419 gene, herein designated GAM GENE, on one or more GAM419 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5743] It is yet further appreciated that specific functions, and accordingly utilities, of GAM419 correlate with, and may be deduced from, the identity of the target

genes which GAM419 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5744] Nucleotide sequences of the GAM419 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM419 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM419 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM419 are further described hereinbelow with reference to Table 1.

[5745] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM419 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5746] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 420 (GAM420) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5747] GAM420 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM420 was detected is described hereinabove with reference to Figs. 2-8.

[5748] GAM420 gene, herein designated GAM GENE, and GAM420 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[5749] GAM420 gene, herein designated GAM GENE, encodes a GAM420 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM420 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM420 precursor RNA is designated SEQ ID:397, and is provided hereinbelow with reference to the sequence listing part.

[5750] GAM420 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM420 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5751] An enzyme complex designated DICER COMPLEX, dices the GAM420 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM420 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM420 RNA is designated SEQ ID:2997, and is provided

hereinbelow with reference to the sequence listing part.

[5752] GAM420 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM420 target RNA, herein designated GAM TARGET RNA. GAM420 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5753] GAM420 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM420 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM420 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM420 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM420 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5754] The complementary binding of GAM420 RNA, herein designated GAM RNA, to target binding sites on GAM420 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM420 target RNA, herein designated GAM TARGET RNA, into GAM420 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5755] It is appreciated that GAM420 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM420 target genes. The mRNA of each one of this plurality of GAM420 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM420 RNA, herein designated GAM RNA, and which when bound by GAM420 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM420 target proteins.

[5756] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM420 gene, herein designated GAM GENE, on one or more GAM420 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5757] It is yet further appreciated that specific functions, and accordingly utilities, of GAM420 correlate with, and may be deduced from, the identity of the target genes which GAM420 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5758] Nucleotide sequences of the GAM420 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM420 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM420 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM420 are further described hereinbelow with reference to Table 1.

[5759] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM420 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5760] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 421 (GAM421) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5761] GAM421 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM421 was detected is

described hereinabove with reference to Figs. 2-8.

[5762] GAM421 gene, herein designated GAM GENE, and GAM421 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5763] GAM421 gene, herein designated GAM GENE, encodes a GAM421 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM421 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM421 precursor RNA is designated SEQ ID:398, and is provided hereinbelow with reference to the sequence listing part.

[5764] GAM421 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM421 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5765] An enzyme complex designated DICER COMPLEX, dices the GAM421 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM421 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM421 RNA is designated SEQ ID:2998, and is provided hereinbelow with reference to the sequence listing part.

[5766] GAM421 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM421 target RNA, herein designated GAM TARGET RNA. GAM421 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5767] GAM421 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM421 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM421 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM421 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM421 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5768] The complementary binding of GAM421 RNA, herein designated GAM RNA, to target binding sites on GAM421 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM421 target RNA, herein designated GAM TARGET RNA, into GAM421 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5769] It is appreciated that GAM421 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM421 target genes. The mRNA of each one of this plurality of GAM421 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM421 RNA, herein designated GAM RNA, and which when bound by GAM421 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM421 target proteins.

[5770] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM421 gene, herein designated GAM GENE, on one or more GAM421 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5771] It is yet further appreciated that specific functions, and accordingly utilities, of GAM421 correlate with, and may be deduced from, the identity of the target genes which GAM421 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5772] Nucleotide sequences of the GAM421 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM421 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM421 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM421 are further described hereinbelow with reference to Table 1.

[5773] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM421 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5774] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 422 (GAM422) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5775] GAM422 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM422 was detected is described hereinabove with reference to Figs. 2-8.

[5776] GAM422 gene, herein designated GAM GENE, and GAM422 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5777] GAM422 gene, herein designated GAM GENE, encodes a GAM422 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM422 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM422 precursor RNA is designated SEQ ID:399, and is provided hereinbelow with reference to the sequence listing part.

[5778] GAM422 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM422 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5779] An enzyme complex designated DICER COMPLEX, dices the GAM422 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM422 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM422 RNA is designated SEQ ID:2999, and is provided hereinbelow with reference to the sequence listing part.

[5780] GAM422 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM422 target RNA, herein designated GAM TARGET RNA. GAM422 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5781] GAM422 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM422 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM422 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM422 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM422 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5782] The complementary binding of GAM422 RNA, herein designated GAM RNA, to target binding sites on GAM422 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM422 target RNA, herein designated GAM TARGET RNA, into GAM422 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5783] It is appreciated that GAM422 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM422 target genes. The mRNA of each one of this plurality of GAM422 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM422 RNA, herein designated GAM RNA, and which when bound by GAM422 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM422 target proteins.

[5784] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM422 gene, herein designated GAM GENE, on one or more GAM422 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5785] It is yet further appreciated that specific functions, and accordingly utilities, of GAM422 correlate with, and may be deduced from, the identity of the target genes which GAM422 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5786] Nucleotide sequences of the GAM422 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM422 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM422 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM422 are further described hereinbelow with reference to Table 1.

[5787] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM422 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5788] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 423 (GAM423) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5789] GAM423 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM423 was detected is described hereinabove with reference to Figs. 2-8.

[5790] GAM423 gene, herein designated GAM GENE, and GAM423 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5791] GAM423 gene, herein designated GAM GENE, encodes a GAM423 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM423 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM423 precursor RNA is designated SEQ ID:400, and is provided hereinbelow with reference to the sequence listing part.

[5792] GAM423 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM423 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5793] An enzyme complex designated DICER COMPLEX, dices the GAM423 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM423 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM423 RNA is designated SEQ ID:3000, and is provided hereinbelow with reference to the sequence listing part.

[5794] GAM423 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM423 target RNA, herein designated GAM TARGET RNA. GAM423 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5795] GAM423 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM423 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM423 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM423 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM423 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5796] The complementary binding of GAM423 RNA, herein designated GAM RNA, to target binding sites on GAM423 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM423 target RNA, herein designated GAM TARGET RNA, into GAM423 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5797] It is appreciated that GAM423 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM423 target genes. The mRNA of each one of this plurality of GAM423 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM423 RNA, herein designated GAM RNA, and which when bound by GAM423 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM423 target proteins.

[5798] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM423 gene, herein designated GAM GENE, on one or more

GAM423 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5799] It is yet further appreciated that specific functions, and accordingly utilities, of GAM423 correlate with, and may be deduced from, the identity of the target genes which GAM423 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5800] Nucleotide sequences of the GAM423 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM423 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM423 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM423 are further described hereinbelow with reference to Table 1.

[5801] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM423 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5802] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 424 (GAM424) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5803] GAM424 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM424 was detected is described hereinabove with reference to Figs. 2-8.

[5804] GAM424 gene, herein designated GAM GENE, and GAM424 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5805] GAM424 gene, herein designated GAM GENE, encodes a GAM424 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM424 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM424 precursor RNA is designated SEQ ID:401, and is provided hereinbelow with reference to the sequence listing part.

[5806] GAM424 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM424 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5807] An enzyme complex designated DICER COMPLEX, dices the GAM424 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM424 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM424 RNA is designated SEQ ID:3001, and is provided hereinbelow with reference to the sequence listing part.

[5808] GAM424 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM424 target RNA, herein designated GAM TARGET RNA. GAM424 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5809] GAM424 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM424 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM424 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM424 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM424 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5810] The complementary binding of GAM424 RNA, herein designated GAM RNA, to target binding sites on GAM424 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM424 target RNA, herein designated GAM TARGET RNA, into GAM424 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5811] It is appreciated that GAM424 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM424 target genes. The mRNA of each one of this plurality of GAM424 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM424 RNA, herein designated GAM RNA, and which when bound by GAM424 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM424 target proteins.

[5812] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM424 gene, herein designated GAM GENE, on one or more GAM424 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5813] It is yet further appreciated that specific functions, and accordingly utilities, of GAM424 correlate with, and may be deduced from, the identity of the target genes which GAM424 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5814] Nucleotide sequences of the GAM424 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM424 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM424 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM424 are further described hereinbelow with reference to Table 1.

[5815] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM424 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5816] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 425 (GAM425) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5817] GAM425 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM425 was detected is described hereinabove with reference to Figs. 2-8.

[5818] GAM425 gene, herein designated GAM GENE, and GAM425 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5819] GAM425 gene, herein designated GAM GENE, encodes a GAM425 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM425 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM425 precursor RNA is designated SEQ ID:402, and is provided hereinbelow with reference to the sequence listing part.

[5820] GAM425 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM425 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5821] An enzyme complex designated DICER COMPLEX, dices the GAM425 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM425 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM425 RNA is designated SEQ ID:3002, and is provided hereinbelow with reference to the sequence listing part.

[5822] GAM425 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM425 target RNA, herein designated GAM TARGET RNA. GAM425 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5823] GAM425 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM425

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM425 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM425 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM425 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5824] The complementary binding of GAM425 RNA, herein designated GAM RNA, to target binding sites on GAM425 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM425 target RNA, herein designated GAM TARGET RNA, into GAM425 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5825] It is appreciated that GAM425 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM425 target genes. The mRNA of each one of this plurality of GAM425 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM425 RNA, herein designated GAM RNA, and which when bound by GAM425 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM425 target proteins.

[5826] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM425 gene, herein designated GAM GENE, on one or more GAM425 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5827] It is yet further appreciated that specific functions, and accordingly utilities, of GAM425 correlate with, and may be deduced from, the identity of the target genes which GAM425 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5828] Nucleotide sequences of the GAM425 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM425 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM425 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM425 are further described hereinbelow with

reference to Table 1.

[5829] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM425 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5830] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 426 (GAM426) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5831] GAM426 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM426 was detected is described hereinabove with reference to Figs. 2-8.

[5832] GAM426 gene, herein designated GAM GENE, and GAM426 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5833] GAM426 gene, herein designated GAM GENE, encodes a GAM426 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM426 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM426 precursor RNA is designated SEQ ID:403, and is provided

hereinbelow with reference to the sequence listing part.

[5834] GAM426 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5835] An enzyme complex designated DICER COMPLEX, dices the GAM426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM426 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM426 RNA is designated SEQ ID:3003, and is provided hereinbelow with reference to the sequence listing part.

[5836] GAM426 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM426 target RNA, herein designated GAM TARGET RNA. GAM426 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[5837] GAM426 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM426 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM426 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM426 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM426 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5838] The complementary binding of GAM426 RNA, herein designated GAM RNA, to target binding sites on GAM426 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM426 target RNA, herein designated GAM TARGET RNA, into GAM426 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5839] It is appreciated that GAM426 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM426 target genes. The mRNA of each one of this plurality of GAM426 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM426 RNA, herein designated GAM RNA, and which when bound by GAM426 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM426 target proteins.

[5840] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM426 gene, herein designated GAM GENE, on one or more GAM426 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5841] It is yet further appreciated that specific functions, and accordingly utilities, of GAM426 correlate with, and may be deduced from, the identity of the target genes which GAM426 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5842] Nucleotide sequences of the GAM426 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM426 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM426 are further described hereinbelow with reference to Table 1.

[5843] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM426 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5844] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 427 (GAM427) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5845] GAM427 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM427 was detected is described hereinabove with reference to Figs. 2-8.

[5846] GAM427 gene, herein designated GAM GENE, and GAM427 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5847] GAM427 gene, herein designated GAM GENE, encodes a GAM427 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM427 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM427 precursor RNA is designated SEQ ID:404, and is provided hereinbelow with reference to the sequence listing part.

[5848] GAM427 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM427 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5849] An enzyme complex designated DICER COMPLEX, dices the GAM427 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM427 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM427 RNA is designated SEQ ID:3004, and is provided hereinbelow with reference to the sequence listing part.

[5850] GAM427 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM427 target RNA, herein designated

GAM TARGET RNA. GAM427 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5851] GAM427 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM427 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM427 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM427 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM427 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5852] The complementary binding of GAM427 RNA, herein designated GAM RNA, to target binding sites on GAM427 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM427 target RNA, herein designated GAM

TARGET RNA, into GAM427 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5853] It is appreciated that GAM427 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM427 target genes. The mRNA of each one of this plurality of GAM427 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM427 RNA, herein designated GAM RNA, and which when bound by GAM427 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM427 target proteins.

[5854] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM427 gene, herein designated GAM GENE, on one or more GAM427 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5855] It is yet further appreciated that specific functions, and accordingly utilities, of GAM427 correlate with, and may be deduced from, the identity of the target

genes which GAM427 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5856] Nucleotide sequences of the GAM427 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM427 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM427 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM427 are further described hereinbelow with reference to Table 1.

[5857] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM427 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5858] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 428 (GAM428) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5859] GAM428 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM428 was detected is described hereinabove with reference to Figs. 2-8.

[5860] GAM428 gene, herein designated GAM GENE, and GAM428 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[5861] GAM428 gene, herein designated GAM GENE, encodes a GAM428 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM428 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM428 precursor RNA is designated SEQ ID:405, and is provided hereinbelow with reference to the sequence listing part.

[5862] GAM428 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM428 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5863] An enzyme complex designated DICER COMPLEX, dices the GAM428 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM428 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM428 RNA is designated SEQ ID:3005, and is provided

hereinbelow with reference to the sequence listing part.

[5864] GAM428 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM428 target RNA, herein designated GAM TARGET RNA. GAM428 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5865] GAM428 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM428 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM428 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM428 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM428 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5866] The complementary binding of GAM428 RNA, herein designated GAM RNA, to target binding sites on GAM428 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM428 target RNA, herein designated GAM TARGET RNA, into GAM428 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5867] It is appreciated that GAM428 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM428 target genes. The mRNA of each one of this plurality of GAM428 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM428 RNA, herein designated GAM RNA, and which when bound by GAM428 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM428 target proteins.

[5868] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM428 gene, herein designated GAM GENE, on one or more GAM428 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5869] It is yet further appreciated that specific functions, and accordingly utilities, of GAM428 correlate with, and may be deduced from, the identity of the target genes which GAM428 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5870] Nucleotide sequences of the GAM428 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM428 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM428 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM428 are further described hereinbelow with reference to Table 1.

[5871] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM428 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5872] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 429 (GAM429) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5873] GAM429 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM429 was detected is

described hereinabove with reference to Figs. 2-8.

[5874] GAM429 gene, herein designated GAM GENE, and GAM429 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5875] GAM429 gene, herein designated GAM GENE, encodes a GAM429 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM429 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM429 precursor RNA is designated SEQ ID:406, and is provided hereinbelow with reference to the sequence listing part.

[5876] GAM429 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM429 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5877] An enzyme complex designated DICER COMPLEX, dices the GAM429 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM429 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM429 RNA is designated SEQ ID:3006, and is provided hereinbelow with reference to the sequence listing part.

[5878] GAM429 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM429 target RNA, herein designated GAM TARGET RNA. GAM429 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5879] GAM429 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM429 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM429 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM429 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM429 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5880] The complementary binding of GAM429 RNA, herein designated GAM RNA, to target binding sites on GAM429 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM429 target RNA, herein designated GAM TARGET RNA, into GAM429 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5881] It is appreciated that GAM429 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM429 target genes. The mRNA of each one of this plurality of GAM429 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM429 RNA, herein designated GAM RNA, and which when bound by GAM429 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM429 target proteins.

[5882] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM429 gene, herein designated GAM GENE, on one or more GAM429 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5883] It is yet further appreciated that specific functions, and accordingly utilities, of GAM429 correlate with, and may be deduced from, the identity of the target genes which GAM429 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5884] Nucleotide sequences of the GAM429 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM429 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM429 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM429 are further described hereinbelow with reference to Table 1.

[5885] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM429 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5886] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 430 (GAM430) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5887] GAM430 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM430 was detected is described hereinabove with reference to Figs. 2-8.

[5888] GAM430 gene, herein designated GAM GENE, and GAM430 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5889] GAM430 gene, herein designated GAM GENE, encodes a GAM430 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM430 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM430 precursor RNA is designated SEQ ID:407, and is provided hereinbelow with reference to the sequence listing part.

[5890] GAM430 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM430 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5891] An enzyme complex designated DICER COMPLEX, dices the GAM430 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM430 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM430 RNA is designated SEQ ID:3007, and is provided hereinbelow with reference to the sequence listing part.

[5892] GAM430 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM430 target RNA, herein designated GAM TARGET RNA. GAM430 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5893] GAM430 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM430 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM430 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM430 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM430 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5894] The complementary binding of GAM430 RNA, herein designated GAM RNA, to target binding sites on GAM430 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM430 target RNA, herein designated GAM TARGET RNA, into GAM430 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5895] It is appreciated that GAM430 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM430 target genes. The mRNA of each one of this plurality of GAM430 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM430 RNA, herein designated GAM RNA, and which when bound by GAM430 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM430 target proteins.

[5896] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM430 gene, herein designated GAM GENE, on one or more GAM430 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5897] It is yet further appreciated that specific functions, and accordingly utilities, of GAM430 correlate with, and may be deduced from, the identity of the target genes which GAM430 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5898] Nucleotide sequences of the GAM430 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM430 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM430 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM430 are further described hereinbelow with reference to Table 1.

[5899] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM430 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5900] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 431 (GAM431) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5901] GAM431 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM431 was detected is described hereinabove with reference to Figs. 2-8.

[5902] GAM431 gene, herein designated GAM GENE, and GAM431 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5903] GAM431 gene, herein designated GAM GENE, encodes a GAM431 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM431 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM431 precursor RNA is designated SEQ ID:408, and is provided hereinbelow with reference to the sequence listing part.

[5904] GAM431 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5905] An enzyme complex designated DICER COMPLEX, dices the GAM431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM431 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM431 RNA is designated SEQ ID:3008, and is provided hereinbelow with reference to the sequence listing part.

[5906] GAM431 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM431 target RNA, herein designated GAM TARGET RNA. GAM431 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5907] GAM431 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM431 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM431 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM431 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM431 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5908] The complementary binding of GAM431 RNA, herein designated GAM RNA, to target binding sites on GAM431 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM431 target RNA, herein designated GAM TARGET RNA, into GAM431 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5909] It is appreciated that GAM431 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM431 target genes. The mRNA of each one of this plurality of GAM431 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM431 RNA, herein designated GAM RNA, and which when bound by GAM431 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM431 target proteins.

[5910] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM431 gene, herein designated GAM GENE, on one or more

GAM431 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5911] It is yet further appreciated that specific functions, and accordingly utilities, of GAM431 correlate with, and may be deduced from, the identity of the target genes which GAM431 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5912] Nucleotide sequences of the GAM431 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM431 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM431 are further described hereinbelow with reference to Table 1.

[5913] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM431 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5914] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 432 (GAM432) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5915] GAM432 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM432 was detected is described hereinabove with reference to Figs. 2-8.

[5916] GAM432 gene, herein designated GAM GENE, and GAM432 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5917] GAM432 gene, herein designated GAM GENE, encodes a GAM432 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM432 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM432 precursor RNA is designated SEQ ID:409, and is provided hereinbelow with reference to the sequence listing part.

[5918] GAM432 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM432 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5919] An enzyme complex designated DICER COMPLEX, dices the GAM432 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM432 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM432 RNA is designated SEQ ID:3009, and is provided hereinbelow with reference to the sequence listing part.

[5920] GAM432 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM432 target RNA, herein designated GAM TARGET RNA. GAM432 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5921] GAM432 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM432 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM432 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM432 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM432 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5922] The complementary binding of GAM432 RNA, herein designated GAM RNA, to target binding sites on GAM432 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM432 target RNA, herein designated GAM TARGET RNA, into GAM432 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5923] It is appreciated that GAM432 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM432 target genes. The mRNA of each one of this plurality of GAM432 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM432 RNA, herein designated GAM RNA, and which when bound by GAM432 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM432 target proteins.

[5924] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM432 gene, herein designated GAM GENE, on one or more GAM432 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5925] It is yet further appreciated that specific functions, and accordingly utilities, of GAM432 correlate with, and may be deduced from, the identity of the target genes which GAM432 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5926] Nucleotide sequences of the GAM432 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM432 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM432 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM432 are further described hereinbelow with reference to Table 1.

[5927] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM432 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5928] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 433 (GAM433) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5929] GAM433 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM433 was detected is described hereinabove with reference to Figs. 2-8.

[5930] GAM433 gene, herein designated GAM GENE, and GAM433 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5931] GAM433 gene, herein designated GAM GENE, encodes a GAM433 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM433 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM433 precursor RNA is designated SEQ ID:410, and is provided hereinbelow with reference to the sequence listing part.

[5932] GAM433 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM433 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5933] An enzyme complex designated DICER COMPLEX, dices the GAM433 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM433 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM433 RNA is designated SEQ ID:3011, and is provided hereinbelow with reference to the sequence listing part.

[5934] GAM433 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM433 target RNA, herein designated GAM TARGET RNA. GAM433 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5935] GAM433 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM433

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM433 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM433 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM433 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5936] The complementary binding of GAM433 RNA, herein designated GAM RNA, to target binding sites on GAM433 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM433 target RNA, herein designated GAM TARGET RNA, into GAM433 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5937] It is appreciated that GAM433 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM433 target genes. The mRNA of each one of this plurality of GAM433 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM433 RNA, herein designated GAM RNA, and which when bound by GAM433 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM433 target proteins.

[5938] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM433 gene, herein designated GAM GENE, on one or more GAM433 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5939] It is yet further appreciated that specific functions, and accordingly utilities, of GAM433 correlate with, and may be deduced from, the identity of the target genes which GAM433 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5940] Nucleotide sequences of the GAM433 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM433 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM433 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM433 are further described hereinbelow with

reference to Table 1.

[5941] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM433 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5942] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 434 (GAM434) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5943] GAM434 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM434 was detected is described hereinabove with reference to Figs. 2-8.

[5944] GAM434 gene, herein designated GAM GENE, and GAM434 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5945] GAM434 gene, herein designated GAM GENE, encodes a GAM434 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM434 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM434 precursor RNA is designated SEQ ID:411, and is provided

hereinbelow with reference to the sequence listing part.

[5946] GAM434 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM434 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5947] An enzyme complex designated DICER COMPLEX, dices the GAM434 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM434 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM434 RNA is designated SEQ ID:3010, and is provided hereinbelow with reference to the sequence listing part.

[5948] GAM434 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM434 target RNA, herein designated GAM TARGET RNA. GAM434 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[5949] GAM434 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM434 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM434 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM434 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM434 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5950] The complementary binding of GAM434 RNA, herein designated GAM RNA, to target binding sites on GAM434 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM434 target RNA, herein designated GAM TARGET RNA, into GAM434 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5951] It is appreciated that GAM434 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM434 target genes. The mRNA of each one of this plurality of GAM434 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM434 RNA, herein designated GAM RNA, and which when bound by GAM434 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM434 target proteins.

[5952] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM434 gene, herein designated GAM GENE, on one or more GAM434 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5953] It is yet further appreciated that specific functions, and accordingly utilities, of GAM434 correlate with, and may be deduced from, the identity of the target genes which GAM434 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5954] Nucleotide sequences of the GAM434 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM434 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM434 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM434 are further described hereinbelow with reference to Table 1.

[5955] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM434 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5956] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 435 (GAM435) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5957] GAM435 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM435 was detected is described hereinabove with reference to Figs. 2-8.

[5958] GAM435 gene, herein designated GAM GENE, and GAM435 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5959] GAM435 gene, herein designated GAM GENE, encodes a GAM435 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM435 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM435 precursor RNA is designated SEQ ID:412, and is provided hereinbelow with reference to the sequence listing part.

[5960] GAM435 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM435 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5961] An enzyme complex designated DICER COMPLEX, dices the GAM435 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM435 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM435 RNA is designated SEQ ID:3012, and is provided hereinbelow with reference to the sequence listing part.

[5962] GAM435 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM435 target RNA, herein designated

GAM TARGET RNA. GAM435 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5963] GAM435 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM435 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM435 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM435 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM435 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5964] The complementary binding of GAM435 RNA, herein designated GAM RNA, to target binding sites on GAM435 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM435 target RNA, herein designated GAM

TARGET RNA, into GAM435 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5965] It is appreciated that GAM435 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM435 target genes. The mRNA of each one of this plurality of GAM435 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM435 RNA, herein designated GAM RNA, and which when bound by GAM435 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM435 target proteins.

[5966] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM435 gene, herein designated GAM GENE, on one or more GAM435 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5967] It is yet further appreciated that specific functions, and accordingly utilities, of GAM435 correlate with, and may be deduced from, the identity of the target

genes which GAM435 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5968] Nucleotide sequences of the GAM435 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM435 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM435 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM435 are further described hereinbelow with reference to Table 1.

[5969] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM435 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5970] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 436 (GAM436) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5971] GAM436 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM436 was detected is described hereinabove with reference to Figs. 2-8.

[5972] GAM436 gene, herein designated GAM GENE, and GAM436 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[5973] GAM436 gene, herein designated GAM GENE, encodes a GAM436 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM436 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM436 precursor RNA is designated SEQ ID:413, and is provided hereinbelow with reference to the sequence listing part.

[5974] GAM436 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM436 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5975] An enzyme complex designated DICER COMPLEX, dices the GAM436 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM436 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM436 RNA is designated SEQ ID:3013, and is provided

hereinbelow with reference to the sequence listing part.

[5976] GAM436 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM436 target RNA, herein designated GAM TARGET RNA. GAM436 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5977] GAM436 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM436 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM436 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM436 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM436 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5978] The complementary binding of GAM436 RNA, herein designated GAM RNA, to target binding sites on GAM436 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM436 target RNA, herein designated GAM TARGET RNA, into GAM436 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5979] It is appreciated that GAM436 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM436 target genes. The mRNA of each one of this plurality of GAM436 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM436 RNA, herein designated GAM RNA, and which when bound by GAM436 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM436 target proteins.

[5980] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM436 gene, herein designated GAM GENE, on one or more GAM436 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5981] It is yet further appreciated that specific functions, and accordingly utilities, of GAM436 correlate with, and may be deduced from, the identity of the target genes which GAM436 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5982] Nucleotide sequences of the GAM436 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM436 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM436 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM436 are further described hereinbelow with reference to Table 1.

[5983] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM436 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5984] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 437 (GAM437) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5985] GAM437 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM437 was detected is

described hereinabove with reference to Figs. 2-8.

[5986] GAM437 gene, herein designated GAM GENE, and GAM437 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[5987] GAM437 gene, herein designated GAM GENE, encodes a GAM437 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM437 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM437 precursor RNA is designated SEQ ID:414, and is provided hereinbelow with reference to the sequence listing part.

[5988] GAM437 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM437 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[5989] An enzyme complex designated DICER COMPLEX, dices the GAM437 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM437 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM437 RNA is designated SEQ ID:3014, and is provided hereinbelow with reference to the sequence listing part.

[5990] GAM437 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM437 target RNA, herein designated GAM TARGET RNA. GAM437 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[5991] GAM437 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM437 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM437 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM437 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM437 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[5992] The complementary binding of GAM437 RNA, herein designated GAM RNA, to target binding sites on GAM437 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM437 target RNA, herein designated GAM TARGET RNA, into GAM437 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[5993] It is appreciated that GAM437 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM437 target genes. The mRNA of each one of this plurality of GAM437 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM437 RNA, herein designated GAM RNA, and which when bound by GAM437 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM437 target proteins.

[5994] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM437 gene, herein designated GAM GENE, on one or more GAM437 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[5995] It is yet further appreciated that specific functions, and accordingly utilities, of GAM437 correlate with, and may be deduced from, the identity of the target genes which GAM437 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[5996] Nucleotide sequences of the GAM437 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM437 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM437 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM437 are further described hereinbelow with reference to Table 1.

[5997] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM437 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[5998] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 438 (GAM438) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[5999] GAM438 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM438 was detected is described hereinabove with reference to Figs. 2-8.

[6000] GAM438 gene, herein designated GAM GENE, and GAM438 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6001] GAM438 gene, herein designated GAM GENE, encodes a GAM438 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM438 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM438 precursor RNA is designated SEQ ID:415, and is provided hereinbelow with reference to the sequence listing part.

[6002] GAM438 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM438 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6003] An enzyme complex designated DICER COMPLEX, dices the GAM438 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM438 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM438 RNA is designated SEQ ID:3015, and is provided hereinbelow with reference to the sequence listing part.

[6004] GAM438 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM438 target RNA, herein designated GAM TARGET RNA. GAM438 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6005] GAM438 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM438 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM438 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM438 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM438 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6006] The complementary binding of GAM438 RNA, herein designated GAM RNA, to target binding sites on GAM438 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM438 target RNA, herein designated GAM TARGET RNA, into GAM438 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6007] It is appreciated that GAM438 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM438 target genes. The mRNA of each one of this plurality of GAM438 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM438 RNA, herein designated GAM RNA, and which when bound by GAM438 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM438 target proteins.

[6008] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM438 gene, herein designated GAM GENE, on one or more GAM438 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6009] It is yet further appreciated that specific functions, and accordingly utilities, of GAM438 correlate with, and may be deduced from, the identity of the target genes which GAM438 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6010] Nucleotide sequences of the GAM438 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM438 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM438 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM438 are further described hereinbelow with reference to Table 1.

[6011] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM438 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6012] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 439 (GAM439) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6013] GAM439 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM439 was detected is described hereinabove with reference to Figs. 2-8.

[6014] GAM439 gene, herein designated GAM GENE, and GAM439 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6015] GAM439 gene, herein designated GAM GENE, encodes a GAM439 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM439 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM439 precursor RNA is designated SEQ ID:416, and is provided hereinbelow with reference to the sequence listing part.

[6016] GAM439 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM439 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6017] An enzyme complex designated DICER COMPLEX, dices the GAM439 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM439 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM439 RNA is designated SEQ ID:3016, and is provided hereinbelow with reference to the sequence listing part.

[6018] GAM439 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM439 target RNA, herein designated GAM TARGET RNA. GAM439 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6019] GAM439 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM439 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM439 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM439 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM439 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6020] The complementary binding of GAM439 RNA, herein designated GAM RNA, to target binding sites on GAM439 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM439 target RNA, herein designated GAM TARGET RNA, into GAM439 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6021] It is appreciated that GAM439 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM439 target genes. The mRNA of each one of this plurality of GAM439 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM439 RNA, herein designated GAM RNA, and which when bound by GAM439 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM439 target proteins.

[6022] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM439 gene, herein designated GAM GENE, on one or more

GAM439 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6023] It is yet further appreciated that specific functions, and accordingly utilities, of GAM439 correlate with, and may be deduced from, the identity of the target genes which GAM439 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6024] Nucleotide sequences of the GAM439 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM439 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM439 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM439 are further described hereinbelow with reference to Table 1.

[6025] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM439 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6026] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 440 (GAM440) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6027] GAM440 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM440 was detected is described hereinabove with reference to Figs. 2-8.

[6028] GAM440 gene, herein designated GAM GENE, and GAM440 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6029] GAM440 gene, herein designated GAM GENE, encodes a GAM440 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM440 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM440 precursor RNA is designated SEQ ID:417, and is provided hereinbelow with reference to the sequence listing part.

[6030] GAM440 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6031] An enzyme complex designated DICER COMPLEX, dices the GAM440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM440 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM440 RNA is designated SEQ ID:3018, and is provided hereinbelow with reference to the sequence listing part.

[6032] GAM440 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM440 target RNA, herein designated GAM TARGET RNA. GAM440 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6033] GAM440 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM440 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM440 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM440 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM440 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6034] The complementary binding of GAM440 RNA, herein designated GAM RNA, to target binding sites on GAM440 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM440 target RNA, herein designated GAM TARGET RNA, into GAM440 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6035] It is appreciated that GAM440 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM440 target genes. The mRNA of each one of this plurality of GAM440 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM440 RNA, herein designated GAM RNA, and which when bound by GAM440 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM440 target proteins.

[6036] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM440 gene, herein designated GAM GENE, on one or more GAM440 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6037] It is yet further appreciated that specific functions, and accordingly utilities, of GAM440 correlate with, and may be deduced from, the identity of the target genes which GAM440 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6038] Nucleotide sequences of the GAM440 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM440 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM440 are further described hereinbelow with reference to Table 1.

[6039] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM440 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6040] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 441 (GAM441) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6041] GAM441 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM441 was detected is described hereinabove with reference to Figs. 2-8.

[6042] GAM441 gene, herein designated GAM GENE, and GAM441 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6043] GAM441 gene, herein designated GAM GENE, encodes a GAM441 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM441 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM441 precursor RNA is designated SEQ ID:418, and is provided hereinbelow with reference to the sequence listing part.

[6044] GAM441 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM441 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6045] An enzyme complex designated DICER COMPLEX, dices the GAM441 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM441 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM441 RNA is designated SEQ ID:3017, and is provided hereinbelow with reference to the sequence listing part.

[6046] GAM441 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM441 target RNA, herein designated GAM TARGET RNA. GAM441 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6047] GAM441 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM441

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM441 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM441 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM441 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6048] The complementary binding of GAM441 RNA, herein designated GAM RNA, to target binding sites on GAM441 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM441 target RNA, herein designated GAM TARGET RNA, into GAM441 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6049] It is appreciated that GAM441 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM441 target genes. The mRNA of each one of this plurality of GAM441 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM441 RNA, herein designated GAM RNA, and which when bound by GAM441 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM441 target proteins.

[6050] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM441 gene, herein designated GAM GENE, on one or more GAM441 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6051] It is yet further appreciated that specific functions, and accordingly utilities, of GAM441 correlate with, and may be deduced from, the identity of the target genes which GAM441 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6052] Nucleotide sequences of the GAM441 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM441 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM441 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM441 are further described hereinbelow with

reference to Table 1.

[6053] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM441 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6054] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 442 (GAM442) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6055] GAM442 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM442 was detected is described hereinabove with reference to Figs. 2-8.

[6056] GAM442 gene, herein designated GAM GENE, and GAM442 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6057] GAM442 gene, herein designated GAM GENE, encodes a GAM442 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM442 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM442 precursor RNA is designated SEQ ID:419, and is provided

hereinbelow with reference to the sequence listing part.

[6058] GAM442 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM442 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6059] An enzyme complex designated DICER COMPLEX, dices the GAM442 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM442 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM442 RNA is designated SEQ ID:3019, and is provided hereinbelow with reference to the sequence listing part.

[6060] GAM442 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM442 target RNA, herein designated GAM TARGET RNA. GAM442 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[6061] GAM442 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM442 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM442 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM442 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM442 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6062] The complementary binding of GAM442 RNA, herein designated GAM RNA, to target binding sites on GAM442 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM442 target RNA, herein designated GAM TARGET RNA, into GAM442 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6063] It is appreciated that GAM442 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM442 target genes. The mRNA of each one of this plurality of GAM442 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM442 RNA, herein designated GAM RNA, and which when bound by GAM442 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM442 target proteins.

[6064] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM442 gene, herein designated GAM GENE, on one or more GAM442 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6065] It is yet further appreciated that specific functions, and accordingly utilities, of GAM442 correlate with, and may be deduced from, the identity of the target genes which GAM442 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6066] Nucleotide sequences of the GAM442 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM442 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM442 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM442 are further described hereinbelow with reference to Table 1.

[6067] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM442 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6068] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 443 (GAM443) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6069] GAM443 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM443 was detected is described hereinabove with reference to Figs. 2-8.

[6070] GAM443 gene, herein designated GAM GENE, and GAM443 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6071] GAM443 gene, herein designated GAM GENE, encodes a GAM443 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM443 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM443 precursor RNA is designated SEQ ID:420, and is provided hereinbelow with reference to the sequence listing part.

[6072] GAM443 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM443 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6073] An enzyme complex designated DICER COMPLEX, dices the GAM443 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM443 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM443 RNA is designated SEQ ID:3020, and is provided hereinbelow with reference to the sequence listing part.

[6074] GAM443 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM443 target RNA, herein designated

GAM TARGET RNA. GAM443 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6075] GAM443 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM443 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM443 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM443 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM443 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6076] The complementary binding of GAM443 RNA, herein designated GAM RNA, to target binding sites on GAM443 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM443 target RNA, herein designated GAM

TARGET RNA, into GAM443 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6077] It is appreciated that GAM443 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM443 target genes. The mRNA of each one of this plurality of GAM443 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM443 RNA, herein designated GAM RNA, and which when bound by GAM443 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM443 target proteins.

[6078] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM443 gene, herein designated GAM GENE, on one or more GAM443 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6079] It is yet further appreciated that specific functions, and accordingly utilities, of GAM443 correlate with, and may be deduced from, the identity of the target

genes which GAM443 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6080] Nucleotide sequences of the GAM443 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM443 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM443 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM443 are further described hereinbelow with reference to Table 1.

[6081] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM443 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6082] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 444 (GAM444) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6083] GAM444 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM444 was detected is described hereinabove with reference to Figs. 2-8.

[6084] GAM444 gene, herein designated GAM GENE, and GAM444 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[6085] GAM444 gene, herein designated GAM GENE, encodes a GAM444 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM444 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM444 precursor RNA is designated SEQ ID:421, and is provided hereinbelow with reference to the sequence listing part.

[6086] GAM444 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM444 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6087] An enzyme complex designated DICER COMPLEX, dices the GAM444 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM444 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM444 RNA is designated SEQ ID:3021, and is provided

hereinbelow with reference to the sequence listing part.

[6088] GAM444 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM444 target RNA, herein designated GAM TARGET RNA. GAM444 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6089] GAM444 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM444 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM444 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM444 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM444 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6090] The complementary binding of GAM444 RNA, herein designated GAM RNA, to target binding sites on GAM444 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM444 target RNA, herein designated GAM TARGET RNA, into GAM444 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6091] It is appreciated that GAM444 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM444 target genes. The mRNA of each one of this plurality of GAM444 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM444 RNA, herein designated GAM RNA, and which when bound by GAM444 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM444 target proteins.

[6092] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM444 gene, herein designated GAM GENE, on one or more GAM444 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6093] It is yet further appreciated that specific functions, and accordingly utilities, of GAM444 correlate with, and may be deduced from, the identity of the target genes which GAM444 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6094] Nucleotide sequences of the GAM444 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM444 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM444 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM444 are further described hereinbelow with reference to Table 1.

[6095] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM444 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6096] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 445 (GAM445) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6097] GAM445 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM445 was detected is

described hereinabove with reference to Figs. 2-8.

[6098] GAM445 gene, herein designated GAM GENE, and GAM445 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6099] GAM445 gene, herein designated GAM GENE, encodes a GAM445 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM445 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM445 precursor RNA is designated SEQ ID:422, and is provided hereinbelow with reference to the sequence listing part.

[6100] GAM445 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM445 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6101] An enzyme complex designated DICER COMPLEX, dices the GAM445 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM445 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM445 RNA is designated SEQ ID:3022, and is provided hereinbelow with reference to the sequence listing part.

[6102] GAM445 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM445 target RNA, herein designated GAM TARGET RNA. GAM445 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6103] GAM445 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM445 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM445 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM445 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM445 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6104] The complementary binding of GAM445 RNA, herein designated GAM RNA, to target binding sites on GAM445 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM445 target RNA, herein designated GAM TARGET RNA, into GAM445 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6105] It is appreciated that GAM445 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM445 target genes. The mRNA of each one of this plurality of GAM445 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM445 RNA, herein designated GAM RNA, and which when bound by GAM445 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM445 target proteins.

[6106] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM445 gene, herein designated GAM GENE, on one or more GAM445 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6107] It is yet further appreciated that specific functions, and accordingly utilities, of GAM445 correlate with, and may be deduced from, the identity of the target genes which GAM445 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6108] Nucleotide sequences of the GAM445 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM445 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM445 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM445 are further described hereinbelow with reference to Table 1.

[6109] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM445 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6110] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 446 (GAM446) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6111] GAM446 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM446 was detected is described hereinabove with reference to Figs. 2-8.

[6112] GAM446 gene, herein designated GAM GENE, and GAM446 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6113] GAM446 gene, herein designated GAM GENE, encodes a GAM446 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM446 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM446 precursor RNA is designated SEQ ID:423, and is provided hereinbelow with reference to the sequence listing part.

[6114] GAM446 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM446 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6115] An enzyme complex designated DICER COMPLEX, dices the GAM446 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM446 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM446 RNA is designated SEQ ID:3023, and is provided hereinbelow with reference to the sequence listing part.

[6116] GAM446 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM446 target RNA, herein designated GAM TARGET RNA. GAM446 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6117] GAM446 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM446 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM446 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM446 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM446 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6118] The complementary binding of GAM446 RNA, herein designated GAM RNA, to target binding sites on GAM446 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM446 target RNA, herein designated GAM TARGET RNA, into GAM446 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6119] It is appreciated that GAM446 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM446 target genes. The mRNA of each one of this plurality of GAM446 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM446 RNA, herein designated GAM RNA, and which when bound by GAM446 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM446 target proteins.

[6120] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM446 gene, herein designated GAM GENE, on one or more GAM446 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6121] It is yet further appreciated that specific functions, and accordingly utilities, of GAM446 correlate with, and may be deduced from, the identity of the target genes which GAM446 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6122] Nucleotide sequences of the GAM446 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM446 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM446 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM446 are further described hereinbelow with reference to Table 1.

[6123] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM446 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6124] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 447 (GAM447) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6125] GAM447 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM447 was detected is described hereinabove with reference to Figs. 2-8.

[6126] GAM447 gene, herein designated GAM GENE, and GAM447 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6127] GAM447 gene, herein designated GAM GENE, encodes a GAM447 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM447 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM447 precursor RNA is designated SEQ ID:424, and is provided hereinbelow with reference to the sequence listing part.

[6128] GAM447 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6129] An enzyme complex designated DICER COMPLEX, dices the GAM447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM447 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM447 RNA is designated SEQ ID:3024, and is provided hereinbelow with reference to the sequence listing part.

[6130] GAM447 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM447 target RNA, herein designated GAM TARGET RNA. GAM447 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6131] GAM447 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM447 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM447 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM447 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM447 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6132] The complementary binding of GAM447 RNA, herein designated GAM RNA, to target binding sites on GAM447 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM447 target RNA, herein designated GAM TARGET RNA, into GAM447 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6133] It is appreciated that GAM447 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM447 target genes. The mRNA of each one of this plurality of GAM447 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM447 RNA, herein designated GAM RNA, and which when bound by GAM447 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM447 target proteins.

[6134] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM447 gene, herein designated GAM GENE, on one or more

GAM447 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6135] It is yet further appreciated that specific functions, and accordingly utilities, of GAM447 correlate with, and may be deduced from, the identity of the target genes which GAM447 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6136] Nucleotide sequences of the GAM447 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM447 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM447 are further described hereinbelow with reference to Table 1.

[6137] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM447 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6138] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 448 (GAM448) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6139] GAM448 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM448 was detected is described hereinabove with reference to Figs. 2-8.

[6140] GAM448 gene, herein designated GAM GENE, and GAM448 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6141] GAM448 gene, herein designated GAM GENE, encodes a GAM448 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM448 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM448 precursor RNA is designated SEQ ID:425, and is provided hereinbelow with reference to the sequence listing part.

[6142] GAM448 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM448 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6143] An enzyme complex designated DICER COMPLEX, dices the GAM448 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM448 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer

together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM448 RNA is designated SEQ ID:3025, and is provided hereinbelow with reference to the sequence listing part.

[6144] GAM448 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM448 target RNA, herein designated GAM TARGET RNA. GAM448 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6145] GAM448 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM448 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM448 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM448 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM448 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or

in both 3UTR and 5UTR regions.

[6146] The complementary binding of GAM448 RNA, herein designated GAM RNA, to target binding sites on GAM448 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM448 target RNA, herein designated GAM TARGET RNA, into GAM448 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6147] It is appreciated that GAM448 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM448 target genes. The mRNA of each one of this plurality of GAM448 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM448 RNA, herein designated GAM RNA, and which when bound by GAM448 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM448 target proteins.

[6148] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM448 gene, herein designated GAM GENE, on one or more GAM448 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other

genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6149] It is yet further appreciated that specific functions, and accordingly utilities, of GAM448 correlate with, and may be deduced from, the identity of the target genes which GAM448 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6150] Nucleotide sequences of the GAM448 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM448 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM448 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM448 are further described hereinbelow with reference to Table 1.

[6151] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM448 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6152] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 449 (GAM449) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6153] GAM449 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM449 was detected is described hereinabove with reference to Figs. 2-8.

[6154] GAM449 gene, herein designated GAM GENE, and GAM449 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6155] GAM449 gene, herein designated GAM GENE, encodes a GAM449 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM449 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM449 precursor RNA is designated SEQ ID:426, and is provided hereinbelow with reference to the sequence listing part.

[6156] GAM449 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM449 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6157] An enzyme complex designated DICER COMPLEX, dices the GAM449 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM449 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM449 RNA is designated SEQ ID:3026, and is provided hereinbelow with reference to the sequence listing part.

[6158] GAM449 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM449 target RNA, herein designated GAM TARGET RNA. GAM449 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6159] GAM449 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM449 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM449 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM449 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM449 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6160] The complementary binding of GAM449 RNA, herein designated GAM RNA, to target binding sites on GAM449 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM449 target RNA, herein designated GAM TARGET RNA, into GAM449 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6161] It is appreciated that GAM449 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM449 target genes. The mRNA of each one of this plurality of GAM449 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM449 RNA, herein designated GAM RNA, and which when bound by GAM449 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM449 target proteins.

[6162] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM449 gene, herein designated GAM GENE, on one or more GAM449 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6163] It is yet further appreciated that specific functions, and accordingly utilities, of GAM449 correlate with, and may be deduced from, the identity of the target genes which GAM449 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6164] Nucleotide sequences of the GAM449 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM449 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM449 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM449 are further described hereinbelow with reference to Table 1.

[6165] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM449 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6166] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 450 (GAM450) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6167] GAM450 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM450 was detected is described hereinabove with reference to Figs. 2-8.

[6168] GAM450 gene, herein designated GAM GENE, and GAM450 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6169] GAM450 gene, herein designated GAM GENE, encodes a GAM450 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM450 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM450 precursor RNA is designated SEQ ID:427, and is provided hereinbelow with reference to the sequence listing part.

[6170] GAM450 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM450 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6171] An enzyme complex designated DICER COMPLEX, dices the GAM450 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM450 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM450 RNA is designated SEQ ID:3027, and is provided hereinbelow with reference to the sequence listing part.

[6172] GAM450 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM450 target RNA, herein designated GAM TARGET RNA. GAM450 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6173] GAM450 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM450 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM450 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM450 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM450 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6174] The complementary binding of GAM450 RNA, herein designated GAM RNA, to target binding sites on GAM450 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM450 target RNA, herein designated GAM TARGET RNA, into GAM450 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6175] It is appreciated that GAM450 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM450 target genes. The mRNA of each one of this plurality of GAM450 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM450 RNA, herein designated GAM RNA, and which when bound by GAM450 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM450 target proteins.

[6176] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM450 gene, herein designated GAM GENE, on one or more

GAM450 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6177] It is yet further appreciated that specific functions, and accordingly utilities, of GAM450 correlate with, and may be deduced from, the identity of the target genes which GAM450 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6178] Nucleotide sequences of the GAM450 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM450 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM450 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM450 are further described hereinbelow with reference to Table 1.

[6179] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM450 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6180] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 451 (GAM451) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6181] GAM451 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM451 was detected is described hereinabove with reference to Figs. 2-8.

[6182] GAM451 gene, herein designated GAM GENE, and GAM451 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6183] GAM451 gene, herein designated GAM GENE, encodes a GAM451 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM451 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM451 precursor RNA is designated SEQ ID:428, and is provided hereinbelow with reference to the sequence listing part.

[6184] GAM451 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM451 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6185] An enzyme complex designated DICER COMPLEX, dices the GAM451 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM451 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM451 RNA is designated SEQ ID:3028, and is provided hereinbelow with reference to the sequence listing part.

[6186] GAM451 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM451 target RNA, herein designated GAM TARGET RNA. GAM451 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6187] GAM451 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM451 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM451 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM451 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM451 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6188] The complementary binding of GAM451 RNA, herein designated GAM RNA, to target binding sites on GAM451 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM451 target RNA, herein designated GAM TARGET RNA, into GAM451 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6189] It is appreciated that GAM451 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM451 target genes. The mRNA of each one of this plurality of GAM451 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM451 RNA, herein designated GAM RNA, and which when bound by GAM451 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM451 target proteins.

[6190] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM451 gene, herein designated GAM GENE, on one or more GAM451 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6191] It is yet further appreciated that specific functions, and accordingly utilities, of GAM451 correlate with, and may be deduced from, the identity of the target genes which GAM451 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6192] Nucleotide sequences of the GAM451 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM451 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM451 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM451 are further described hereinbelow with reference to Table 1.

[6193] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM451 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6194] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 452 (GAM452) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6195] GAM452 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM452 was detected is described hereinabove with reference to Figs. 2-8.

[6196] GAM452 gene, herein designated GAM GENE, and GAM452 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6197] GAM452 gene, herein designated GAM GENE, encodes a GAM452 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM452 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM452 precursor RNA is designated SEQ ID:429, and is provided hereinbelow with reference to the sequence listing part.

[6198] GAM452 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM452 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6199] An enzyme complex designated DICER COMPLEX, dices the GAM452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM452 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM452 RNA is designated SEQ ID:3029, and is provided hereinbelow with reference to the sequence listing part.

[6200] GAM452 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM452 target RNA, herein designated GAM TARGET RNA. GAM452 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6201] GAM452 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM452

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM452 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM452 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM452 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6202] The complementary binding of GAM452 RNA, herein designated GAM RNA, to target binding sites on GAM452 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM452 target RNA, herein designated GAM TARGET RNA, into GAM452 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6203] It is appreciated that GAM452 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM452 target genes. The mRNA of each one of this plurality of GAM452 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM452 RNA, herein designated GAM RNA, and which when bound by GAM452 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM452 target proteins.

[6204] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM452 gene, herein designated GAM GENE, on one or more GAM452 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6205] It is yet further appreciated that specific functions, and accordingly utilities, of GAM452 correlate with, and may be deduced from, the identity of the target genes which GAM452 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6206] Nucleotide sequences of the GAM452 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM452 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM452 are further described hereinbelow with

reference to Table 1.

[6207] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM452 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6208] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 453 (GAM453) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6209] GAM453 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM453 was detected is described hereinabove with reference to Figs. 2-8.

[6210] GAM453 gene, herein designated GAM GENE, and GAM453 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6211] GAM453 gene, herein designated GAM GENE, encodes a GAM453 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM453 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM453 precursor RNA is designated SEQ ID:430, and is provided

hereinbelow with reference to the sequence listing part.

[6212] GAM453 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM453 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6213] An enzyme complex designated DICER COMPLEX, dices the GAM453 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM453 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM453 RNA is designated SEQ ID:3030, and is provided hereinbelow with reference to the sequence listing part.

[6214] GAM453 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM453 target RNA, herein designated GAM TARGET RNA. GAM453 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[6215] GAM453 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM453 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM453 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM453 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM453 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6216] The complementary binding of GAM453 RNA, herein designated GAM RNA, to target binding sites on GAM453 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM453 target RNA, herein designated GAM TARGET RNA, into GAM453 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6217] It is appreciated that GAM453 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM453 target genes. The mRNA of each one of this plurality of GAM453 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM453 RNA, herein designated GAM RNA, and which when bound by GAM453 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM453 target proteins.

[6218] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM453 gene, herein designated GAM GENE, on one or more GAM453 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6219] It is yet further appreciated that specific functions, and accordingly utilities, of GAM453 correlate with, and may be deduced from, the identity of the target genes which GAM453 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6220] Nucleotide sequences of the GAM453 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM453 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM453 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM453 are further described hereinbelow with reference to Table 1.

[6221] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM453 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6222] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 454 (GAM454) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6223] GAM454 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM454 was detected is described hereinabove with reference to Figs. 2-8.

[6224] GAM454 gene, herein designated GAM GENE, and GAM454 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6225] GAM454 gene, herein designated GAM GENE, encodes a GAM454 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM454 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM454 precursor RNA is designated SEQ ID:431, and is provided hereinbelow with reference to the sequence listing part.

[6226] GAM454 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM454 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6227] An enzyme complex designated DICER COMPLEX, dices the GAM454 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM454 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM454 RNA is designated SEQ ID:3032, and is provided hereinbelow with reference to the sequence listing part.

[6228] GAM454 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM454 target RNA, herein designated

GAM TARGET RNA. GAM454 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6229] GAM454 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM454 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM454 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM454 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM454 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6230] The complementary binding of GAM454 RNA, herein designated GAM RNA, to target binding sites on GAM454 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM454 target RNA, herein designated GAM

TARGET RNA, into GAM454 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6231] It is appreciated that GAM454 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM454 target genes. The mRNA of each one of this plurality of GAM454 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM454 RNA, herein designated GAM RNA, and which when bound by GAM454 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM454 target proteins.

[6232] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM454 gene, herein designated GAM GENE, on one or more GAM454 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6233] It is yet further appreciated that specific functions, and accordingly utilities, of GAM454 correlate with, and may be deduced from, the identity of the target

genes which GAM454 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6234] Nucleotide sequences of the GAM454 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM454 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM454 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM454 are further described hereinbelow with reference to Table 1.

[6235] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM454 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6236] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 455 (GAM455) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6237] GAM455 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM455 was detected is described hereinabove with reference to Figs. 2-8.

[6238] GAM455 gene, herein designated GAM GENE, and GAM455 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[6239] GAM455 gene, herein designated GAM GENE, encodes a GAM455 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM455 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM455 precursor RNA is designated SEQ ID:432, and is provided hereinbelow with reference to the sequence listing part.

[6240] GAM455 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM455 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6241] An enzyme complex designated DICER COMPLEX, dices the GAM455 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM455 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM455 RNA is designated SEQ ID:3031, and is provided

hereinbelow with reference to the sequence listing part.

[6242] GAM455 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM455 target RNA, herein designated GAM TARGET RNA. GAM455 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6243] GAM455 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM455 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM455 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM455 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM455 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6244] The complementary binding of GAM455 RNA, herein designated GAM RNA, to target binding sites on GAM455 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM455 target RNA, herein designated GAM TARGET RNA, into GAM455 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6245] It is appreciated that GAM455 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM455 target genes. The mRNA of each one of this plurality of GAM455 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM455 RNA, herein designated GAM RNA, and which when bound by GAM455 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM455 target proteins.

[6246] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM455 gene, herein designated GAM GENE, on one or more GAM455 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6247] It is yet further appreciated that specific functions, and accordingly utilities, of GAM455 correlate with, and may be deduced from, the identity of the target genes which GAM455 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6248] Nucleotide sequences of the GAM455 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM455 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM455 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM455 are further described hereinbelow with reference to Table 1.

[6249] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM455 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6250] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 456 (GAM456) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6251] GAM456 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM456 was detected is

described hereinabove with reference to Figs. 2-8.

[6252] GAM456 gene, herein designated GAM GENE, and GAM456 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6253] GAM456 gene, herein designated GAM GENE, encodes a GAM456 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM456 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM456 precursor RNA is designated SEQ ID:433, and is provided hereinbelow with reference to the sequence listing part.

[6254] GAM456 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM456 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6255] An enzyme complex designated DICER COMPLEX, dices the GAM456 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM456 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM456 RNA is designated SEQ ID:3033, and is provided hereinbelow with reference to the sequence listing part.

[6256] GAM456 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM456 target RNA, herein designated GAM TARGET RNA. GAM456 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6257] GAM456 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM456 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM456 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM456 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM456 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6258] The complementary binding of GAM456 RNA, herein designated GAM RNA, to target binding sites on GAM456 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM456 target RNA, herein designated GAM TARGET RNA, into GAM456 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6259] It is appreciated that GAM456 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM456 target genes. The mRNA of each one of this plurality of GAM456 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM456 RNA, herein designated GAM RNA, and which when bound by GAM456 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM456 target proteins.

[6260] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM456 gene, herein designated GAM GENE, on one or more GAM456 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6261] It is yet further appreciated that specific functions, and accordingly utilities, of GAM456 correlate with, and may be deduced from, the identity of the target genes which GAM456 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6262] Nucleotide sequences of the GAM456 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM456 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM456 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM456 are further described hereinbelow with reference to Table 1.

[6263] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM456 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6264] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 457 (GAM457) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6265] GAM457 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM457 was detected is described hereinabove with reference to Figs. 2-8.

[6266] GAM457 gene, herein designated GAM GENE, and GAM457 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6267] GAM457 gene, herein designated GAM GENE, encodes a GAM457 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM457 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM457 precursor RNA is designated SEQ ID:434, and is provided hereinbelow with reference to the sequence listing part.

[6268] GAM457 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM457 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6269] An enzyme complex designated DICER COMPLEX, dices the GAM457 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM457 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM457 RNA is designated SEQ ID:3034, and is provided hereinbelow with reference to the sequence listing part.

[6270] GAM457 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM457 target RNA, herein designated GAM TARGET RNA. GAM457 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6271] GAM457 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM457 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM457 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM457 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM457 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6272] The complementary binding of GAM457 RNA, herein designated GAM RNA, to target binding sites on GAM457 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM457 target RNA, herein designated GAM TARGET RNA, into GAM457 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6273] It is appreciated that GAM457 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM457 target genes. The mRNA of each one of this plurality of GAM457 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM457 RNA, herein designated GAM RNA, and which when bound by GAM457 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM457 target proteins.

[6274] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM457 gene, herein designated GAM GENE, on one or more GAM457 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6275] It is yet further appreciated that specific functions, and accordingly utilities, of GAM457 correlate with, and may be deduced from, the identity of the target genes which GAM457 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6276] Nucleotide sequences of the GAM457 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM457 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM457 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM457 are further described hereinbelow with reference to Table 1.

[6277] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM457 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6278] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 458 (GAM458) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6279] GAM458 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM458 was detected is described hereinabove with reference to Figs. 2-8.

[6280] GAM458 gene, herein designated GAM GENE, and GAM458 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6281] GAM458 gene, herein designated GAM GENE, encodes a GAM458 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM458 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM458 precursor RNA is designated SEQ ID:435, and is provided hereinbelow with reference to the sequence listing part.

[6282] GAM458 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM458 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6283] An enzyme complex designated DICER COMPLEX, dices the GAM458 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM458 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM458 RNA is designated SEQ ID:3035, and is provided hereinbelow with reference to the sequence listing part.

[6284] GAM458 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM458 target RNA, herein designated GAM TARGET RNA. GAM458 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6285] GAM458 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM458 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM458 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM458 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM458 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6286] The complementary binding of GAM458 RNA, herein designated GAM RNA, to target binding sites on GAM458 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM458 target RNA, herein designated GAM TARGET RNA, into GAM458 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6287] It is appreciated that GAM458 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM458 target genes. The mRNA of each one of this plurality of GAM458 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM458 RNA, herein designated GAM RNA, and which when bound by GAM458 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM458 target proteins.

[6288] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM458 gene, herein designated GAM GENE, on one or more

GAM458 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6289] It is yet further appreciated that specific functions, and accordingly utilities, of GAM458 correlate with, and may be deduced from, the identity of the target genes which GAM458 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6290] Nucleotide sequences of the GAM458 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM458 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM458 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM458 are further described hereinbelow with reference to Table 1.

[6291] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM458 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6292] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 459 (GAM459) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6293] GAM459 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM459 was detected is described hereinabove with reference to Figs. 2-8.

[6294] GAM459 gene, herein designated GAM GENE, and GAM459 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6295] GAM459 gene, herein designated GAM GENE, encodes a GAM459 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM459 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM459 precursor RNA is designated SEQ ID:436, and is provided hereinbelow with reference to the sequence listing part.

[6296] GAM459 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM459 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6297] An enzyme complex designated DICER COMPLEX, dices the GAM459 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM459 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM459 RNA is designated SEQ ID:3036, and is provided hereinbelow with reference to the sequence listing part.

[6298] GAM459 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM459 target RNA, herein designated GAM TARGET RNA. GAM459 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6299] GAM459 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM459 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM459 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM459 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM459 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6300] The complementary binding of GAM459 RNA, herein designated GAM RNA, to target binding sites on GAM459 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM459 target RNA, herein designated GAM TARGET RNA, into GAM459 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6301] It is appreciated that GAM459 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM459 target genes. The mRNA of each one of this plurality of GAM459 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM459 RNA, herein designated GAM RNA, and which when bound by GAM459 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM459 target proteins.

[6302] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM459 gene, herein designated GAM GENE, on one or more GAM459 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6303] It is yet further appreciated that specific functions, and accordingly utilities, of GAM459 correlate with, and may be deduced from, the identity of the target genes which GAM459 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6304] Nucleotide sequences of the GAM459 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM459 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM459 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM459 are further described hereinbelow with reference to Table 1.

[6305] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM459 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6306] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 460 (GAM460) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6307] GAM460 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM460 was detected is described hereinabove with reference to Figs. 2-8.

[6308] GAM460 gene, herein designated GAM GENE, and GAM460 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6309] GAM460 gene, herein designated GAM GENE, encodes a GAM460 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM460 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM460 precursor RNA is designated SEQ ID:437, and is provided hereinbelow with reference to the sequence listing part.

[6310] GAM460 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM460 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6311] An enzyme complex designated DICER COMPLEX, dices the GAM460 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM460 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM460 RNA is designated SEQ ID:3037, and is provided hereinbelow with reference to the sequence listing part.

[6312] GAM460 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM460 target RNA, herein designated GAM TARGET RNA. GAM460 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6313] GAM460 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM460

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM460 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM460 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM460 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6314] The complementary binding of GAM460 RNA, herein designated GAM RNA, to target binding sites on GAM460 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM460 target RNA, herein designated GAM TARGET RNA, into GAM460 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6315] It is appreciated that GAM460 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM460 target genes. The mRNA of each one of this plurality of GAM460 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM460 RNA, herein designated GAM RNA, and which when bound by GAM460 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM460 target proteins.

[6316] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM460 gene, herein designated GAM GENE, on one or more GAM460 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6317] It is yet further appreciated that specific functions, and accordingly utilities, of GAM460 correlate with, and may be deduced from, the identity of the target genes which GAM460 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6318] Nucleotide sequences of the GAM460 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM460 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM460 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM460 are further described hereinbelow with

reference to Table 1.

[6319] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM460 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6320] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 461 (GAM461) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6321] GAM461 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM461 was detected is described hereinabove with reference to Figs. 2-8.

[6322] GAM461 gene, herein designated GAM GENE, and GAM461 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6323] GAM461 gene, herein designated GAM GENE, encodes a GAM461 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM461 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM461 precursor RNA is designated SEQ ID:438, and is provided

hereinbelow with reference to the sequence listing part.

[6324] GAM461 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM461 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6325] An enzyme complex designated DICER COMPLEX, dices the GAM461 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM461 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM461 RNA is designated SEQ ID:3038, and is provided hereinbelow with reference to the sequence listing part.

[6326] GAM461 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM461 target RNA, herein designated GAM TARGET RNA. GAM461 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[6327] GAM461 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM461 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM461 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM461 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM461 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6328] The complementary binding of GAM461 RNA, herein designated GAM RNA, to target binding sites on GAM461 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM461 target RNA, herein designated GAM TARGET RNA, into GAM461 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6329] It is appreciated that GAM461 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM461 target genes. The mRNA of each one of this plurality of GAM461 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM461 RNA, herein designated GAM RNA, and which when bound by GAM461 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM461 target proteins.

[6330] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM461 gene, herein designated GAM GENE, on one or more GAM461 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6331] It is yet further appreciated that specific functions, and accordingly utilities, of GAM461 correlate with, and may be deduced from, the identity of the target genes which GAM461 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6332] Nucleotide sequences of the GAM461 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM461 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM461 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM461 are further described hereinbelow with reference to Table 1.

[6333] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM461 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6334] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 462 (GAM462) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6335] GAM462 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM462 was detected is described hereinabove with reference to Figs. 2-8.

[6336] GAM462 gene, herein designated GAM GENE, and GAM462 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6337] GAM462 gene, herein designated GAM GENE, encodes a GAM462 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM462 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM462 precursor RNA is designated SEQ ID:439, and is provided hereinbelow with reference to the sequence listing part.

[6338] GAM462 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM462 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6339] An enzyme complex designated DICER COMPLEX, dices the GAM462 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM462 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM462 RNA is designated SEQ ID:3039, and is provided hereinbelow with reference to the sequence listing part.

[6340] GAM462 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM462 target RNA, herein designated

GAM TARGET RNA. GAM462 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6341] GAM462 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM462 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM462 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM462 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM462 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6342] The complementary binding of GAM462 RNA, herein designated GAM RNA, to target binding sites on GAM462 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM462 target RNA, herein designated GAM

TARGET RNA, into GAM462 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6343] It is appreciated that GAM462 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM462 target genes. The mRNA of each one of this plurality of GAM462 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM462 RNA, herein designated GAM RNA, and which when bound by GAM462 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM462 target proteins.

[6344] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM462 gene, herein designated GAM GENE, on one or more GAM462 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6345] It is yet further appreciated that specific functions, and accordingly utilities, of GAM462 correlate with, and may be deduced from, the identity of the target

genes which GAM462 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6346] Nucleotide sequences of the GAM462 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM462 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM462 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM462 are further described hereinbelow with reference to Table 1.

[6347] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM462 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6348] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 463 (GAM463) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6349] GAM463 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM463 was detected is described hereinabove with reference to Figs. 2-8.

[6350] GAM463 gene, herein designated GAM GENE, and GAM463 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[6351] GAM463 gene, herein designated GAM GENE, encodes a GAM463 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM463 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM463 precursor RNA is designated SEQ ID:440, and is provided hereinbelow with reference to the sequence listing part.

[6352] GAM463 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM463 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6353] An enzyme complex designated DICER COMPLEX, dices the GAM463 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM463 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM463 RNA is designated SEQ ID:3040, and is provided

hereinbelow with reference to the sequence listing part.

[6354] GAM463 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM463 target RNA, herein designated GAM TARGET RNA. GAM463 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6355] GAM463 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM463 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM463 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM463 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM463 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6356] The complementary binding of GAM463 RNA, herein designated GAM RNA, to target binding sites on GAM463 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM463 target RNA, herein designated GAM TARGET RNA, into GAM463 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6357] It is appreciated that GAM463 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM463 target genes. The mRNA of each one of this plurality of GAM463 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM463 RNA, herein designated GAM RNA, and which when bound by GAM463 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM463 target proteins.

[6358] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM463 gene, herein designated GAM GENE, on one or more GAM463 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6359] It is yet further appreciated that specific functions, and accordingly utilities, of GAM463 correlate with, and may be deduced from, the identity of the target genes which GAM463 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6360] Nucleotide sequences of the GAM463 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM463 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM463 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM463 are further described hereinbelow with reference to Table 1.

[6361] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM463 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6362] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 464 (GAM464) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6363] GAM464 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM464 was detected is

described hereinabove with reference to Figs. 2-8.

[6364] GAM464 gene, herein designated GAM GENE, and GAM464 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6365] GAM464 gene, herein designated GAM GENE, encodes a GAM464 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM464 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM464 precursor RNA is designated SEQ ID:441, and is provided hereinbelow with reference to the sequence listing part.

[6366] GAM464 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM464 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6367] An enzyme complex designated DICER COMPLEX, dices the GAM464 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM464 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM464 RNA is designated SEQ ID:3041, and is provided hereinbelow with reference to the sequence listing part.

[6368] GAM464 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM464 target RNA, herein designated GAM TARGET RNA. GAM464 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6369] GAM464 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM464 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM464 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM464 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM464 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6370] The complementary binding of GAM464 RNA, herein designated GAM RNA, to target binding sites on GAM464 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM464 target RNA, herein designated GAM TARGET RNA, into GAM464 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6371] It is appreciated that GAM464 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM464 target genes. The mRNA of each one of this plurality of GAM464 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM464 RNA, herein designated GAM RNA, and which when bound by GAM464 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM464 target proteins.

[6372] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM464 gene, herein designated GAM GENE, on one or more GAM464 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6373] It is yet further appreciated that specific functions, and accordingly utilities, of GAM464 correlate with, and may be deduced from, the identity of the target genes which GAM464 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6374] Nucleotide sequences of the GAM464 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM464 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM464 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM464 are further described hereinbelow with reference to Table 1.

[6375] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM464 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6376] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 465 (GAM465) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6377] GAM465 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM465 was detected is described hereinabove with reference to Figs. 2-8.

[6378] GAM465 gene, herein designated GAM GENE, and GAM465 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6379] GAM465 gene, herein designated GAM GENE, encodes a GAM465 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM465 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM465 precursor RNA is designated SEQ ID:442, and is provided hereinbelow with reference to the sequence listing part.

[6380] GAM465 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM465 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6381] An enzyme complex designated DICER COMPLEX, dices the GAM465 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM465 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM465 RNA is designated SEQ ID:3042, and is provided hereinbelow with reference to the sequence listing part.

[6382] GAM465 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM465 target RNA, herein designated GAM TARGET RNA. GAM465 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6383] GAM465 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM465 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM465 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM465 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM465 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6384] The complementary binding of GAM465 RNA, herein designated GAM RNA, to target binding sites on GAM465 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM465 target RNA, herein designated GAM TARGET RNA, into GAM465 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6385] It is appreciated that GAM465 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM465 target genes. The mRNA of each one of this plurality of GAM465 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM465 RNA, herein designated GAM RNA, and which when bound by GAM465 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM465 target proteins.

[6386] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM465 gene, herein designated GAM GENE, on one or more GAM465 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6387] It is yet further appreciated that specific functions, and accordingly utilities, of GAM465 correlate with, and may be deduced from, the identity of the target genes which GAM465 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6388] Nucleotide sequences of the GAM465 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM465 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM465 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM465 are further described hereinbelow with reference to Table 1.

[6389] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM465 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6390] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 466 (GAM466) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6391] GAM466 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM466 was detected is described hereinabove with reference to Figs. 2-8.

[6392] GAM466 gene, herein designated GAM GENE, and GAM466 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6393] GAM466 gene, herein designated GAM GENE, encodes a GAM466 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM466 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM466 precursor RNA is designated SEQ ID:443, and is provided hereinbelow with reference to the sequence listing part.

[6394] GAM466 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM466 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6395] An enzyme complex designated DICER COMPLEX, dices the GAM466 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM466 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM466 RNA is designated SEQ ID:3043, and is provided hereinbelow with reference to the sequence listing part.

[6396] GAM466 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM466 target RNA, herein designated GAM TARGET RNA. GAM466 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6397] GAM466 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM466 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM466 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM466 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM466 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6398] The complementary binding of GAM466 RNA, herein designated GAM RNA, to target binding sites on GAM466 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM466 target RNA, herein designated GAM TARGET RNA, into GAM466 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6399] It is appreciated that GAM466 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM466 target genes. The mRNA of each one of this plurality of GAM466 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM466 RNA, herein designated GAM RNA, and which when bound by GAM466 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM466 target proteins.

[6400] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM466 gene, herein designated GAM GENE, on one or more

GAM466 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6401] It is yet further appreciated that specific functions, and accordingly utilities, of GAM466 correlate with, and may be deduced from, the identity of the target genes which GAM466 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6402] Nucleotide sequences of the GAM466 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM466 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM466 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM466 are further described hereinbelow with reference to Table 1.

[6403] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM466 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6404] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 467 (GAM467) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6405] GAM467 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM467 was detected is described hereinabove with reference to Figs. 2-8.

[6406] GAM467 gene, herein designated GAM GENE, and GAM467 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6407] GAM467 gene, herein designated GAM GENE, encodes a GAM467 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM467 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM467 precursor RNA is designated SEQ ID:444, and is provided hereinbelow with reference to the sequence listing part.

[6408] GAM467 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM467 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6409] An enzyme complex designated DICER COMPLEX, dices the GAM467 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM467 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM467 RNA is designated SEQ ID:3044, and is provided hereinbelow with reference to the sequence listing part.

[6410] GAM467 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM467 target RNA, herein designated GAM TARGET RNA. GAM467 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6411] GAM467 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM467 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM467 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM467 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM467 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6412] The complementary binding of GAM467 RNA, herein designated GAM RNA, to target binding sites on GAM467 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM467 target RNA, herein designated GAM TARGET RNA, into GAM467 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6413] It is appreciated that GAM467 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM467 target genes. The mRNA of each one of this plurality of GAM467 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM467 RNA, herein designated GAM RNA, and which when bound by GAM467 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM467 target proteins.

[6414] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM467 gene, herein designated GAM GENE, on one or more GAM467 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6415] It is yet further appreciated that specific functions, and accordingly utilities, of GAM467 correlate with, and may be deduced from, the identity of the target genes which GAM467 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6416] Nucleotide sequences of the GAM467 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM467 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM467 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM467 are further described hereinbelow with reference to Table 1.

[6417] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM467 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6418] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 468 (GAM468) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6419] GAM468 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM468 was detected is described hereinabove with reference to Figs. 2-8.

[6420] GAM468 gene, herein designated GAM GENE, and GAM468 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6421] GAM468 gene, herein designated GAM GENE, encodes a GAM468 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM468 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM468 precursor RNA is designated SEQ ID:445, and is provided hereinbelow with reference to the sequence listing part.

[6422] GAM468 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM468 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6423] An enzyme complex designated DICER COMPLEX, dices the GAM468 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM468 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM468 RNA is designated SEQ ID:3045, and is provided hereinbelow with reference to the sequence listing part.

[6424] GAM468 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM468 target RNA, herein designated GAM TARGET RNA. GAM468 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6425] GAM468 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM468

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM468 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM468 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM468 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6426] The complementary binding of GAM468 RNA, herein designated GAM RNA, to target binding sites on GAM468 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM468 target RNA, herein designated GAM TARGET RNA, into GAM468 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6427] It is appreciated that GAM468 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM468 target genes. The mRNA of each one of this plurality of GAM468 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM468 RNA, herein designated GAM RNA, and which when bound by GAM468 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM468 target proteins.

[6428] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM468 gene, herein designated GAM GENE, on one or more GAM468 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6429] It is yet further appreciated that specific functions, and accordingly utilities, of GAM468 correlate with, and may be deduced from, the identity of the target genes which GAM468 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6430] Nucleotide sequences of the GAM468 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM468 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM468 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM468 are further described hereinbelow with

reference to Table 1.

[6431] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM468 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6432] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 469 (GAM469) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6433] GAM469 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM469 was detected is described hereinabove with reference to Figs. 2-8.

[6434] GAM469 gene, herein designated GAM GENE, and GAM469 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6435] GAM469 gene, herein designated GAM GENE, encodes a GAM469 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM469 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM469 precursor RNA is designated SEQ ID:446, and is provided

hereinbelow with reference to the sequence listing part.

[6436] GAM469 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM469 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6437] An enzyme complex designated DICER COMPLEX, dices the GAM469 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM469 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM469 RNA is designated SEQ ID:3046, and is provided hereinbelow with reference to the sequence listing part.

[6438] GAM469 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM469 target RNA, herein designated GAM TARGET RNA. GAM469 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[6439] GAM469 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM469 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM469 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM469 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM469 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6440] The complementary binding of GAM469 RNA, herein designated GAM RNA, to target binding sites on GAM469 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM469 target RNA, herein designated GAM TARGET RNA, into GAM469 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6441] It is appreciated that GAM469 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM469 target genes. The mRNA of each one of this plurality of GAM469 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM469 RNA, herein designated GAM RNA, and which when bound by GAM469 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM469 target proteins.

[6442] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM469 gene, herein designated GAM GENE, on one or more GAM469 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6443] It is yet further appreciated that specific functions, and accordingly utilities, of GAM469 correlate with, and may be deduced from, the identity of the target genes which GAM469 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6444] Nucleotide sequences of the GAM469 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM469 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM469 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM469 are further described hereinbelow with reference to Table 1.

[6445] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM469 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6446] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 470 (GAM470) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6447] GAM470 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM470 was detected is described hereinabove with reference to Figs. 2-8.

[6448] GAM470 gene, herein designated GAM GENE, and GAM470 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6449] GAM470 gene, herein designated GAM GENE, encodes a GAM470 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM470 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM470 precursor RNA is designated SEQ ID:447, and is provided hereinbelow with reference to the sequence listing part.

[6450] GAM470 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM470 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6451] An enzyme complex designated DICER COMPLEX, dices the GAM470 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM470 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM470 RNA is designated SEQ ID:3047, and is provided hereinbelow with reference to the sequence listing part.

[6452] GAM470 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM470 target RNA, herein designated

GAM TARGET RNA. GAM470 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6453] GAM470 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM470 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM470 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM470 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM470 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6454] The complementary binding of GAM470 RNA, herein designated GAM RNA, to target binding sites on GAM470 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM470 target RNA, herein designated GAM

TARGET RNA, into GAM470 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6455] It is appreciated that GAM470 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM470 target genes. The mRNA of each one of this plurality of GAM470 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM470 RNA, herein designated GAM RNA, and which when bound by GAM470 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM470 target proteins.

[6456] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM470 gene, herein designated GAM GENE, on one or more GAM470 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6457] It is yet further appreciated that specific functions, and accordingly utilities, of GAM470 correlate with, and may be deduced from, the identity of the target

genes which GAM470 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6458] Nucleotide sequences of the GAM470 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM470 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM470 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM470 are further described hereinbelow with reference to Table 1.

[6459] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM470 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6460] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 471 (GAM471) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6461] GAM471 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM471 was detected is described hereinabove with reference to Figs. 2-8.

[6462] GAM471 gene, herein designated GAM GENE, and GAM471 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[6463] GAM471 gene, herein designated GAM GENE, encodes a GAM471 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM471 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM471 precursor RNA is designated SEQ ID:448, and is provided hereinbelow with reference to the sequence listing part.

[6464] GAM471 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM471 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6465] An enzyme complex designated DICER COMPLEX, dices the GAM471 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM471 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM471 RNA is designated SEQ ID:3049, and is provided

hereinbelow with reference to the sequence listing part.

[6466] GAM471 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM471 target RNA, herein designated GAM TARGET RNA. GAM471 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6467] GAM471 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM471 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM471 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM471 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM471 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6468] The complementary binding of GAM471 RNA, herein designated GAM RNA, to target binding sites on GAM471 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM471 target RNA, herein designated GAM TARGET RNA, into GAM471 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6469] It is appreciated that GAM471 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM471 target genes. The mRNA of each one of this plurality of GAM471 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM471 RNA, herein designated GAM RNA, and which when bound by GAM471 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM471 target proteins.

[6470] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM471 gene, herein designated GAM GENE, on one or more GAM471 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6471] It is yet further appreciated that specific functions, and accordingly utilities, of GAM471 correlate with, and may be deduced from, the identity of the target genes which GAM471 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6472] Nucleotide sequences of the GAM471 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM471 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM471 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM471 are further described hereinbelow with reference to Table 1.

[6473] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM471 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6474] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 472 (GAM472) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6475] GAM472 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM472 was detected is

described hereinabove with reference to Figs. 2-8.

[6476] GAM472 gene, herein designated GAM GENE, and GAM472 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6477] GAM472 gene, herein designated GAM GENE, encodes a GAM472 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM472 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM472 precursor RNA is designated SEQ ID:449, and is provided hereinbelow with reference to the sequence listing part.

[6478] GAM472 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM472 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6479] An enzyme complex designated DICER COMPLEX, dices the GAM472 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM472 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM472 RNA is designated SEQ ID:3048, and is provided hereinbelow with reference to the sequence listing part.

[6480] GAM472 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM472 target RNA, herein designated GAM TARGET RNA. GAM472 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6481] GAM472 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM472 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM472 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM472 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM472 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6482] The complementary binding of GAM472 RNA, herein designated GAM RNA, to target binding sites on GAM472 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM472 target RNA, herein designated GAM TARGET RNA, into GAM472 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6483] It is appreciated that GAM472 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM472 target genes. The mRNA of each one of this plurality of GAM472 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM472 RNA, herein designated GAM RNA, and which when bound by GAM472 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM472 target proteins.

[6484] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM472 gene, herein designated GAM GENE, on one or more GAM472 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6485] It is yet further appreciated that specific functions, and accordingly utilities, of GAM472 correlate with, and may be deduced from, the identity of the target genes which GAM472 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6486] Nucleotide sequences of the GAM472 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM472 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM472 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM472 are further described hereinbelow with reference to Table 1.

[6487] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM472 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6488] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 473 (GAM473) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6489] GAM473 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM473 was detected is described hereinabove with reference to Figs. 2-8.

[6490] GAM473 gene, herein designated GAM GENE, and GAM473 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6491] GAM473 gene, herein designated GAM GENE, encodes a GAM473 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM473 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM473 precursor RNA is designated SEQ ID:450, and is provided hereinbelow with reference to the sequence listing part.

[6492] GAM473 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM473 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6493] An enzyme complex designated DICER COMPLEX, dices the GAM473 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM473 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM473 RNA is designated SEQ ID:3051, and is provided hereinbelow with reference to the sequence listing part.

[6494] GAM473 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM473 target RNA, herein designated GAM TARGET RNA. GAM473 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6495] GAM473 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM473 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM473 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM473 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM473 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6496] The complementary binding of GAM473 RNA, herein designated GAM RNA, to target binding sites on GAM473 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM473 target RNA, herein designated GAM TARGET RNA, into GAM473 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6497] It is appreciated that GAM473 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM473 target genes. The mRNA of each one of this plurality of GAM473 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM473 RNA, herein designated GAM RNA, and which when bound by GAM473 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM473 target proteins.

[6498] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM473 gene, herein designated GAM GENE, on one or more GAM473 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6499] It is yet further appreciated that specific functions, and accordingly utilities, of GAM473 correlate with, and may be deduced from, the identity of the target genes which GAM473 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6500] Nucleotide sequences of the GAM473 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM473 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM473 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM473 are further described hereinbelow with reference to Table 1.

[6501] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM473 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6502] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 474 (GAM474) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6503] GAM474 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM474 was detected is described hereinabove with reference to Figs. 2-8.

[6504] GAM474 gene, herein designated GAM GENE, and GAM474 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6505] GAM474 gene, herein designated GAM GENE, encodes a GAM474 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM474 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM474 precursor RNA is designated SEQ ID:451, and is provided hereinbelow with reference to the sequence listing part.

[6506] GAM474 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM474 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6507] An enzyme complex designated DICER COMPLEX, dices the GAM474 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM474 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM474 RNA is designated SEQ ID:3050, and is provided hereinbelow with reference to the sequence listing part.

[6508] GAM474 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM474 target RNA, herein designated GAM TARGET RNA. GAM474 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6509] GAM474 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM474 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM474 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM474 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM474 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6510] The complementary binding of GAM474 RNA, herein designated GAM RNA, to target binding sites on GAM474 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM474 target RNA, herein designated GAM TARGET RNA, into GAM474 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6511] It is appreciated that GAM474 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM474 target genes. The mRNA of each one of this plurality of GAM474 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM474 RNA, herein designated GAM RNA, and which when bound by GAM474 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM474 target proteins.

[6512] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM474 gene, herein designated GAM GENE, on one or more

GAM474 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6513] It is yet further appreciated that specific functions, and accordingly utilities, of GAM474 correlate with, and may be deduced from, the identity of the target genes which GAM474 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6514] Nucleotide sequences of the GAM474 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM474 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM474 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM474 are further described hereinbelow with reference to Table 1.

[6515] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM474 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6516] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 475 (GAM475) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6517] GAM475 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM475 was detected is described hereinabove with reference to Figs. 2-8.

[6518] GAM475 gene, herein designated GAM GENE, and GAM475 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6519] GAM475 gene, herein designated GAM GENE, encodes a GAM475 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM475 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM475 precursor RNA is designated SEQ ID:452, and is provided hereinbelow with reference to the sequence listing part.

[6520] GAM475 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM475 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6521] An enzyme complex designated DICER COMPLEX, dices the GAM475 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM475 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM475 RNA is designated SEQ ID:3052, and is provided hereinbelow with reference to the sequence listing part.

[6522] GAM475 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM475 target RNA, herein designated GAM TARGET RNA. GAM475 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6523] GAM475 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM475 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM475 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM475 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM475 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6524] The complementary binding of GAM475 RNA, herein designated GAM RNA, to target binding sites on GAM475 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM475 target RNA, herein designated GAM TARGET RNA, into GAM475 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6525] It is appreciated that GAM475 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM475 target genes. The mRNA of each one of this plurality of GAM475 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM475 RNA, herein designated GAM RNA, and which when bound by GAM475 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM475 target proteins.

[6526] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM475 gene, herein designated GAM GENE, on one or more GAM475 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6527] It is yet further appreciated that specific functions, and accordingly utilities, of GAM475 correlate with, and may be deduced from, the identity of the target genes which GAM475 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6528] Nucleotide sequences of the GAM475 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM475 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM475 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM475 are further described hereinbelow with reference to Table 1.

[6529] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM475 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6530] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 476 (GAM476) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6531] GAM476 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM476 was detected is described hereinabove with reference to Figs. 2-8.

[6532] GAM476 gene, herein designated GAM GENE, and GAM476 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6533] GAM476 gene, herein designated GAM GENE, encodes a GAM476 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM476 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM476 precursor RNA is designated SEQ ID:453, and is provided hereinbelow with reference to the sequence listing part.

[6534] GAM476 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM476 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6535] An enzyme complex designated DICER COMPLEX, dices the GAM476 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM476 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM476 RNA is designated SEQ ID:3053, and is provided hereinbelow with reference to the sequence listing part.

[6536] GAM476 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM476 target RNA, herein designated GAM TARGET RNA. GAM476 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6537] GAM476 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM476

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM476 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM476 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM476 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6538] The complementary binding of GAM476 RNA, herein designated GAM RNA, to target binding sites on GAM476 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM476 target RNA, herein designated GAM TARGET RNA, into GAM476 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6539] It is appreciated that GAM476 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM476 target genes. The mRNA of each one of this plurality of GAM476 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM476 RNA, herein designated GAM RNA, and which when bound by GAM476 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM476 target proteins.

[6540] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM476 gene, herein designated GAM GENE, on one or more GAM476 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6541] It is yet further appreciated that specific functions, and accordingly utilities, of GAM476 correlate with, and may be deduced from, the identity of the target genes which GAM476 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6542] Nucleotide sequences of the GAM476 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM476 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM476 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM476 are further described hereinbelow with

reference to Table 1.

[6543] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM476 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6544] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 477 (GAM477) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6545] GAM477 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM477 was detected is described hereinabove with reference to Figs. 2-8.

[6546] GAM477 gene, herein designated GAM GENE, and GAM477 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6547] GAM477 gene, herein designated GAM GENE, encodes a GAM477 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM477 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM477 precursor RNA is designated SEQ ID:454, and is provided

hereinbelow with reference to the sequence listing part.

[6548] GAM477 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM477 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6549] An enzyme complex designated DICER COMPLEX, dices the GAM477 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM477 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM477 RNA is designated SEQ ID:3054, and is provided hereinbelow with reference to the sequence listing part.

[6550] GAM477 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM477 target RNA, herein designated GAM TARGET RNA. GAM477 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[6551] GAM477 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM477 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM477 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM477 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM477 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6552] The complementary binding of GAM477 RNA, herein designated GAM RNA, to target binding sites on GAM477 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM477 target RNA, herein designated GAM TARGET RNA, into GAM477 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6553] It is appreciated that GAM477 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM477 target genes. The mRNA of each one of this plurality of GAM477 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM477 RNA, herein designated GAM RNA, and which when bound by GAM477 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM477 target proteins.

[6554] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM477 gene, herein designated GAM GENE, on one or more GAM477 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6555] It is yet further appreciated that specific functions, and accordingly utilities, of GAM477 correlate with, and may be deduced from, the identity of the target genes which GAM477 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6556] Nucleotide sequences of the GAM477 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM477 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM477 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM477 are further described hereinbelow with reference to Table 1.

[6557] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM477 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6558] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 478 (GAM478) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6559] GAM478 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM478 was detected is described hereinabove with reference to Figs. 2-8.

[6560] GAM478 gene, herein designated GAM GENE, and GAM478 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6561] GAM478 gene, herein designated GAM GENE, encodes a GAM478 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM478 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM478 precursor RNA is designated SEQ ID:455, and is provided hereinbelow with reference to the sequence listing part.

[6562] GAM478 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM478 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6563] An enzyme complex designated DICER COMPLEX, dices the GAM478 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM478 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM478 RNA is designated SEQ ID:3055, and is provided hereinbelow with reference to the sequence listing part.

[6564] GAM478 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM478 target RNA, herein designated

GAM TARGET RNA. GAM478 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6565] GAM478 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM478 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM478 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM478 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM478 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6566] The complementary binding of GAM478 RNA, herein designated GAM RNA, to target binding sites on GAM478 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM478 target RNA, herein designated GAM

TARGET RNA, into GAM478 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6567] It is appreciated that GAM478 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM478 target genes. The mRNA of each one of this plurality of GAM478 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM478 RNA, herein designated GAM RNA, and which when bound by GAM478 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM478 target proteins.

[6568] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM478 gene, herein designated GAM GENE, on one or more GAM478 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6569] It is yet further appreciated that specific functions, and accordingly utilities, of GAM478 correlate with, and may be deduced from, the identity of the target

genes which GAM478 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6570] Nucleotide sequences of the GAM478 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM478 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM478 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM478 are further described hereinbelow with reference to Table 1.

[6571] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM478 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6572] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 479 (GAM479) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6573] GAM479 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM479 was detected is described hereinabove with reference to Figs. 2-8.

[6574] GAM479 gene, herein designated GAM GENE, and GAM479 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[6575] GAM479 gene, herein designated GAM GENE, encodes a GAM479 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM479 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM479 precursor RNA is designated SEQ ID:456, and is provided hereinbelow with reference to the sequence listing part.

[6576] GAM479 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6577] An enzyme complex designated DICER COMPLEX, dices the GAM479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM479 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM479 RNA is designated SEQ ID:3056, and is provided

hereinbelow with reference to the sequence listing part.

[6578] GAM479 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM479 target RNA, herein designated GAM TARGET RNA. GAM479 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6579] GAM479 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM479 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM479 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM479 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM479 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6580] The complementary binding of GAM479 RNA, herein designated GAM RNA, to target binding sites on GAM479 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM479 target RNA, herein designated GAM TARGET RNA, into GAM479 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6581] It is appreciated that GAM479 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM479 target genes. The mRNA of each one of this plurality of GAM479 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM479 RNA, herein designated GAM RNA, and which when bound by GAM479 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM479 target proteins.

[6582] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM479 gene, herein designated GAM GENE, on one or more GAM479 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6583] It is yet further appreciated that specific functions, and accordingly utilities, of GAM479 correlate with, and may be deduced from, the identity of the target genes which GAM479 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6584] Nucleotide sequences of the GAM479 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM479 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM479 are further described hereinbelow with reference to Table 1.

[6585] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM479 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6586] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 480 (GAM480) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6587] GAM480 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM480 was detected is

described hereinabove with reference to Figs. 2-8.

[6588] GAM480 gene, herein designated GAM GENE, and GAM480 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6589] GAM480 gene, herein designated GAM GENE, encodes a GAM480 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM480 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM480 precursor RNA is designated SEQ ID:457, and is provided hereinbelow with reference to the sequence listing part.

[6590] GAM480 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM480 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6591] An enzyme complex designated DICER COMPLEX, dices the GAM480 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM480 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM480 RNA is designated SEQ ID:3057, and is provided hereinbelow with reference to the sequence listing part.

[6592] GAM480 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM480 target RNA, herein designated GAM TARGET RNA. GAM480 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6593] GAM480 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM480 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM480 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM480 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM480 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6594] The complementary binding of GAM480 RNA, herein designated GAM RNA, to target binding sites on GAM480 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM480 target RNA, herein designated GAM TARGET RNA, into GAM480 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6595] It is appreciated that GAM480 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM480 target genes. The mRNA of each one of this plurality of GAM480 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM480 RNA, herein designated GAM RNA, and which when bound by GAM480 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM480 target proteins.

[6596] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM480 gene, herein designated GAM GENE, on one or more GAM480 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6597] It is yet further appreciated that specific functions, and accordingly utilities, of GAM480 correlate with, and may be deduced from, the identity of the target genes which GAM480 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6598] Nucleotide sequences of the GAM480 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM480 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM480 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM480 are further described hereinbelow with reference to Table 1.

[6599] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM480 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6600] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 481 (GAM481) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6601] GAM481 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM481 was detected is described hereinabove with reference to Figs. 2-8.

[6602] GAM481 gene, herein designated GAM GENE, and GAM481 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6603] GAM481 gene, herein designated GAM GENE, encodes a GAM481 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM481 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM481 precursor RNA is designated SEQ ID:458, and is provided hereinbelow with reference to the sequence listing part.

[6604] GAM481 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM481 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6605] An enzyme complex designated DICER COMPLEX, dices the GAM481 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM481 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM481 RNA is designated SEQ ID:3058, and is provided hereinbelow with reference to the sequence listing part.

[6606] GAM481 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM481 target RNA, herein designated GAM TARGET RNA. GAM481 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6607] GAM481 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM481 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM481 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM481 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM481 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6608] The complementary binding of GAM481 RNA, herein designated GAM RNA, to target binding sites on GAM481 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM481 target RNA, herein designated GAM TARGET RNA, into GAM481 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6609] It is appreciated that GAM481 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM481 target genes. The mRNA of each one of this plurality of GAM481 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM481 RNA, herein designated GAM RNA, and which when bound by GAM481 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM481 target proteins.

[6610] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM481 gene, herein designated GAM GENE, on one or more GAM481 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6611] It is yet further appreciated that specific functions, and accordingly utilities, of GAM481 correlate with, and may be deduced from, the identity of the target genes which GAM481 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6612] Nucleotide sequences of the GAM481 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM481 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM481 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM481 are further described hereinbelow with reference to Table 1.

[6613] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM481 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6614] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 482 (GAM482) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6615] GAM482 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM482 was detected is described hereinabove with reference to Figs. 2-8.

[6616] GAM482 gene, herein designated GAM GENE, and GAM482 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6617] GAM482 gene, herein designated GAM GENE, encodes a GAM482 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM482 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM482 precursor RNA is designated SEQ ID:459, and is provided hereinbelow with reference to the sequence listing part.

[6618] GAM482 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM482 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6619] An enzyme complex designated DICER COMPLEX, dices the GAM482 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM482 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM482 RNA is designated SEQ ID:3059, and is provided hereinbelow with reference to the sequence listing part.

[6620] GAM482 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM482 target RNA, herein designated GAM TARGET RNA. GAM482 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6621] GAM482 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM482 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM482 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM482 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM482 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6622] The complementary binding of GAM482 RNA, herein designated GAM RNA, to target binding sites on GAM482 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM482 target RNA, herein designated GAM TARGET RNA, into GAM482 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6623] It is appreciated that GAM482 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM482 target genes. The mRNA of each one of this plurality of GAM482 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM482 RNA, herein designated GAM RNA, and which when bound by GAM482 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM482 target proteins.

[6624] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM482 gene, herein designated GAM GENE, on one or more

GAM482 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6625] It is yet further appreciated that specific functions, and accordingly utilities, of GAM482 correlate with, and may be deduced from, the identity of the target genes which GAM482 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6626] Nucleotide sequences of the GAM482 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM482 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM482 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM482 are further described hereinbelow with reference to Table 1.

[6627] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM482 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6628] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 483 (GAM483) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6629] GAM483 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM483 was detected is described hereinabove with reference to Figs. 2-8.

[6630] GAM483 gene, herein designated GAM GENE, and GAM483 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6631] GAM483 gene, herein designated GAM GENE, encodes a GAM483 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM483 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM483 precursor RNA is designated SEQ ID:460, and is provided hereinbelow with reference to the sequence listing part.

[6632] GAM483 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM483 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6633] An enzyme complex designated DICER COMPLEX, dices the GAM483 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM483 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM483 RNA is designated SEQ ID:3060, and is provided hereinbelow with reference to the sequence listing part.

[6634] GAM483 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM483 target RNA, herein designated GAM TARGET RNA. GAM483 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6635] GAM483 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM483 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM483 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM483 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM483 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6636] The complementary binding of GAM483 RNA, herein designated GAM RNA, to target binding sites on GAM483 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM483 target RNA, herein designated GAM TARGET RNA, into GAM483 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6637] It is appreciated that GAM483 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM483 target genes. The mRNA of each one of this plurality of GAM483 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM483 RNA, herein designated GAM RNA, and which when bound by GAM483 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM483 target proteins.

[6638] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM483 gene, herein designated GAM GENE, on one or more GAM483 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6639] It is yet further appreciated that specific functions, and accordingly utilities, of GAM483 correlate with, and may be deduced from, the identity of the target genes which GAM483 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6640] Nucleotide sequences of the GAM483 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM483 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM483 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM483 are further described hereinbelow with reference to Table 1.

[6641] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM483 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6642] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 484 (GAM484) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6643] GAM484 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM484 was detected is described hereinabove with reference to Figs. 2-8.

[6644] GAM484 gene, herein designated GAM GENE, and GAM484 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6645] GAM484 gene, herein designated GAM GENE, encodes a GAM484 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM484 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM484 precursor RNA is designated SEQ ID:461, and is provided hereinbelow with reference to the sequence listing part.

[6646] GAM484 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM484 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6647] An enzyme complex designated DICER COMPLEX, dices the GAM484 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM484 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM484 RNA is designated SEQ ID:3061, and is provided hereinbelow with reference to the sequence listing part.

[6648] GAM484 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM484 target RNA, herein designated GAM TARGET RNA. GAM484 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6649] GAM484 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM484

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM484 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM484 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM484 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6650] The complementary binding of GAM484 RNA, herein designated GAM RNA, to target binding sites on GAM484 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM484 target RNA, herein designated GAM TARGET RNA, into GAM484 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6651] It is appreciated that GAM484 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM484 target genes. The mRNA of each one of this plurality of GAM484 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM484 RNA, herein designated GAM RNA, and which when bound by GAM484 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM484 target proteins.

[6652] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM484 gene, herein designated GAM GENE, on one or more GAM484 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6653] It is yet further appreciated that specific functions, and accordingly utilities, of GAM484 correlate with, and may be deduced from, the identity of the target genes which GAM484 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6654] Nucleotide sequences of the GAM484 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM484 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM484 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM484 are further described hereinbelow with

reference to Table 1.

[6655] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM484 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6656] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 485 (GAM485) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6657] GAM485 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM485 was detected is described hereinabove with reference to Figs. 2-8.

[6658] GAM485 gene, herein designated GAM GENE, and GAM485 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6659] GAM485 gene, herein designated GAM GENE, encodes a GAM485 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM485 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM485 precursor RNA is designated SEQ ID:462, and is provided

hereinbelow with reference to the sequence listing part.

[6660] GAM485 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM485 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6661] An enzyme complex designated DICER COMPLEX, dices the GAM485 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM485 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM485 RNA is designated SEQ ID:3063, and is provided hereinbelow with reference to the sequence listing part.

[6662] GAM485 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM485 target RNA, herein designated GAM TARGET RNA. GAM485 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[6663] GAM485 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM485 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM485 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM485 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM485 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6664] The complementary binding of GAM485 RNA, herein designated GAM RNA, to target binding sites on GAM485 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM485 target RNA, herein designated GAM TARGET RNA, into GAM485 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6665] It is appreciated that GAM485 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM485 target genes. The mRNA of each one of this plurality of GAM485 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM485 RNA, herein designated GAM RNA, and which when bound by GAM485 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM485 target proteins.

[6666] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM485 gene, herein designated GAM GENE, on one or more GAM485 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6667] It is yet further appreciated that specific functions, and accordingly utilities, of GAM485 correlate with, and may be deduced from, the identity of the target genes which GAM485 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6668] Nucleotide sequences of the GAM485 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM485 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM485 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM485 are further described hereinbelow with reference to Table 1.

[6669] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM485 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6670] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 486 (GAM486) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6671] GAM486 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM486 was detected is described hereinabove with reference to Figs. 2-8.

[6672] GAM486 gene, herein designated GAM GENE, and GAM486 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6673] GAM486 gene, herein designated GAM GENE, encodes a GAM486 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM486 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM486 precursor RNA is designated SEQ ID:463, and is provided hereinbelow with reference to the sequence listing part.

[6674] GAM486 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM486 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6675] An enzyme complex designated DICER COMPLEX, dices the GAM486 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM486 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM486 RNA is designated SEQ ID:3062, and is provided hereinbelow with reference to the sequence listing part.

[6676] GAM486 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM486 target RNA, herein designated

GAM TARGET RNA. GAM486 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6677] GAM486 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM486 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM486 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM486 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM486 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6678] The complementary binding of GAM486 RNA, herein designated GAM RNA, to target binding sites on GAM486 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM486 target RNA, herein designated GAM

TARGET RNA, into GAM486 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6679] It is appreciated that GAM486 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM486 target genes. The mRNA of each one of this plurality of GAM486 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM486 RNA, herein designated GAM RNA, and which when bound by GAM486 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM486 target proteins.

[6680] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM486 gene, herein designated GAM GENE, on one or more GAM486 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6681] It is yet further appreciated that specific functions, and accordingly utilities, of GAM486 correlate with, and may be deduced from, the identity of the target

genes which GAM486 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6682] Nucleotide sequences of the GAM486 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM486 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM486 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM486 are further described hereinbelow with reference to Table 1.

[6683] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM486 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6684] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 487 (GAM487) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6685] GAM487 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM487 was detected is described hereinabove with reference to Figs. 2-8.

[6686] GAM487 gene, herein designated GAM GENE, and GAM487 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[6687] GAM487 gene, herein designated GAM GENE, encodes a GAM487 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM487 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM487 precursor RNA is designated SEQ ID:464, and is provided hereinbelow with reference to the sequence listing part.

[6688] GAM487 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM487 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6689] An enzyme complex designated DICER COMPLEX, dices the GAM487 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM487 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM487 RNA is designated SEQ ID:3064, and is provided

hereinbelow with reference to the sequence listing part.

[6690] GAM487 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM487 target RNA, herein designated GAM TARGET RNA. GAM487 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6691] GAM487 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM487 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM487 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM487 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM487 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6692] The complementary binding of GAM487 RNA, herein designated GAM RNA, to target binding sites on GAM487 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM487 target RNA, herein designated GAM TARGET RNA, into GAM487 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6693] It is appreciated that GAM487 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM487 target genes. The mRNA of each one of this plurality of GAM487 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM487 RNA, herein designated GAM RNA, and which when bound by GAM487 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM487 target proteins.

[6694] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM487 gene, herein designated GAM GENE, on one or more GAM487 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6695] It is yet further appreciated that specific functions, and accordingly utilities, of GAM487 correlate with, and may be deduced from, the identity of the target genes which GAM487 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6696] Nucleotide sequences of the GAM487 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM487 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM487 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM487 are further described hereinbelow with reference to Table 1.

[6697] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM487 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6698] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 488 (GAM488) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6699] GAM488 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM488 was detected is

described hereinabove with reference to Figs. 2-8.

[6700] GAM488 gene, herein designated GAM GENE, and GAM488 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6701] GAM488 gene, herein designated GAM GENE, encodes a GAM488 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM488 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM488 precursor RNA is designated SEQ ID:465, and is provided hereinbelow with reference to the sequence listing part.

[6702] GAM488 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM488 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6703] An enzyme complex designated DICER COMPLEX, dices the GAM488 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM488 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM488 RNA is designated SEQ ID:3065, and is provided hereinbelow with reference to the sequence listing part.

[6704] GAM488 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM488 target RNA, herein designated GAM TARGET RNA. GAM488 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6705] GAM488 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM488 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM488 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM488 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM488 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6706] The complementary binding of GAM488 RNA, herein designated GAM RNA, to target binding sites on GAM488 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM488 target RNA, herein designated GAM TARGET RNA, into GAM488 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6707] It is appreciated that GAM488 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM488 target genes. The mRNA of each one of this plurality of GAM488 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM488 RNA, herein designated GAM RNA, and which when bound by GAM488 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM488 target proteins.

[6708] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM488 gene, herein designated GAM GENE, on one or more GAM488 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6709] It is yet further appreciated that specific functions, and accordingly utilities, of GAM488 correlate with, and may be deduced from, the identity of the target genes which GAM488 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6710] Nucleotide sequences of the GAM488 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM488 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM488 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM488 are further described hereinbelow with reference to Table 1.

[6711] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM488 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6712] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 489 (GAM489) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6713] GAM489 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM489 was detected is described hereinabove with reference to Figs. 2-8.

[6714] GAM489 gene, herein designated GAM GENE, and GAM489 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6715] GAM489 gene, herein designated GAM GENE, encodes a GAM489 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM489 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM489 precursor RNA is designated SEQ ID:466, and is provided hereinbelow with reference to the sequence listing part.

[6716] GAM489 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM489 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6717] An enzyme complex designated DICER COMPLEX, dices the GAM489 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM489 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM489 RNA is designated SEQ ID:3066, and is provided hereinbelow with reference to the sequence listing part.

[6718] GAM489 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM489 target RNA, herein designated GAM TARGET RNA. GAM489 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6719] GAM489 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM489 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM489 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM489 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM489 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6720] The complementary binding of GAM489 RNA, herein designated GAM RNA, to target binding sites on GAM489 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM489 target RNA, herein designated GAM TARGET RNA, into GAM489 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6721] It is appreciated that GAM489 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM489 target genes. The mRNA of each one of this plurality of GAM489 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM489 RNA, herein designated GAM RNA, and which when bound by GAM489 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM489 target proteins.

[6722] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM489 gene, herein designated GAM GENE, on one or more GAM489 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6723] It is yet further appreciated that specific functions, and accordingly utilities, of GAM489 correlate with, and may be deduced from, the identity of the target genes which GAM489 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6724] Nucleotide sequences of the GAM489 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM489 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM489 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM489 are further described hereinbelow with reference to Table 1.

[6725] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM489 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6726] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 490 (GAM490) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6727] GAM490 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM490 was detected is described hereinabove with reference to Figs. 2-8.

[6728] GAM490 gene, herein designated GAM GENE, and GAM490 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6729] GAM490 gene, herein designated GAM GENE, encodes a GAM490 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM490 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM490 precursor RNA is designated SEQ ID:467, and is provided hereinbelow with reference to the sequence listing part.

[6730] GAM490 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM490 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6731] An enzyme complex designated DICER COMPLEX, dices the GAM490 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM490 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM490 RNA is designated SEQ ID:3067, and is provided hereinbelow with reference to the sequence listing part.

[6732] GAM490 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM490 target RNA, herein designated GAM TARGET RNA. GAM490 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6733] GAM490 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM490 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM490 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM490 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM490 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6734] The complementary binding of GAM490 RNA, herein designated GAM RNA, to target binding sites on GAM490 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM490 target RNA, herein designated GAM TARGET RNA, into GAM490 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6735] It is appreciated that GAM490 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM490 target genes. The mRNA of each one of this plurality of GAM490 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM490 RNA, herein designated GAM RNA, and which when bound by GAM490 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM490 target proteins.

[6736] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM490 gene, herein designated GAM GENE, on one or more

GAM490 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6737] It is yet further appreciated that specific functions, and accordingly utilities, of GAM490 correlate with, and may be deduced from, the identity of the target genes which GAM490 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6738] Nucleotide sequences of the GAM490 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM490 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM490 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM490 are further described hereinbelow with reference to Table 1.

[6739] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM490 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6740] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 491 (GAM491) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6741] GAM491 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM491 was detected is described hereinabove with reference to Figs. 2-8.

[6742] GAM491 gene, herein designated GAM GENE, and GAM491 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6743] GAM491 gene, herein designated GAM GENE, encodes a GAM491 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM491 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM491 precursor RNA is designated SEQ ID:468, and is provided hereinbelow with reference to the sequence listing part.

[6744] GAM491 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM491 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6745] An enzyme complex designated DICER COMPLEX, dices the GAM491 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM491 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM491 RNA is designated SEQ ID:3068, and is provided hereinbelow with reference to the sequence listing part.

[6746] GAM491 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM491 target RNA, herein designated GAM TARGET RNA. GAM491 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6747] GAM491 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM491 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM491 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM491 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM491 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6748] The complementary binding of GAM491 RNA, herein designated GAM RNA, to target binding sites on GAM491 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM491 target RNA, herein designated GAM TARGET RNA, into GAM491 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6749] It is appreciated that GAM491 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM491 target genes. The mRNA of each one of this plurality of GAM491 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM491 RNA, herein designated GAM RNA, and which when bound by GAM491 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM491 target proteins.

[6750] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM491 gene, herein designated GAM GENE, on one or more GAM491 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6751] It is yet further appreciated that specific functions, and accordingly utilities, of GAM491 correlate with, and may be deduced from, the identity of the target genes which GAM491 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6752] Nucleotide sequences of the GAM491 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM491 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM491 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM491 are further described hereinbelow with reference to Table 1.

[6753] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM491 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6754] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 492 (GAM492) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6755] GAM492 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM492 was detected is described hereinabove with reference to Figs. 2-8.

[6756] GAM492 gene, herein designated GAM GENE, and GAM492 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6757] GAM492 gene, herein designated GAM GENE, encodes a GAM492 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM492 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM492 precursor RNA is designated SEQ ID:469, and is provided hereinbelow with reference to the sequence listing part.

[6758] GAM492 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM492 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6759] An enzyme complex designated DICER COMPLEX, dices the GAM492 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM492 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM492 RNA is designated SEQ ID:3069, and is provided hereinbelow with reference to the sequence listing part.

[6760] GAM492 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM492 target RNA, herein designated GAM TARGET RNA. GAM492 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6761] GAM492 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM492

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM492 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM492 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM492 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6762] The complementary binding of GAM492 RNA, herein designated GAM RNA, to target binding sites on GAM492 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM492 target RNA, herein designated GAM TARGET RNA, into GAM492 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6763] It is appreciated that GAM492 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM492 target genes. The mRNA of each one of this plurality of GAM492 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM492 RNA, herein designated GAM RNA, and which when bound by GAM492 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM492 target proteins.

[6764] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM492 gene, herein designated GAM GENE, on one or more GAM492 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6765] It is yet further appreciated that specific functions, and accordingly utilities, of GAM492 correlate with, and may be deduced from, the identity of the target genes which GAM492 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6766] Nucleotide sequences of the GAM492 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM492 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM492 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM492 are further described hereinbelow with

reference to Table 1.

[6767] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM492 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6768] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 493 (GAM493) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6769] GAM493 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM493 was detected is described hereinabove with reference to Figs. 2-8.

[6770] GAM493 gene, herein designated GAM GENE, and GAM493 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6771] GAM493 gene, herein designated GAM GENE, encodes a GAM493 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM493 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM493 precursor RNA is designated SEQ ID:470, and is provided

hereinbelow with reference to the sequence listing part.

[6772] GAM493 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM493 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6773] An enzyme complex designated DICER COMPLEX, dices the GAM493 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM493 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM493 RNA is designated SEQ ID:3070, and is provided hereinbelow with reference to the sequence listing part.

[6774] GAM493 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM493 target RNA, herein designated GAM TARGET RNA. GAM493 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[6775] GAM493 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM493 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM493 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM493 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM493 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6776] The complementary binding of GAM493 RNA, herein designated GAM RNA, to target binding sites on GAM493 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM493 target RNA, herein designated GAM TARGET RNA, into GAM493 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6777] It is appreciated that GAM493 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM493 target genes. The mRNA of each one of this plurality of GAM493 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM493 RNA, herein designated GAM RNA, and which when bound by GAM493 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM493 target proteins.

[6778] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM493 gene, herein designated GAM GENE, on one or more GAM493 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6779] It is yet further appreciated that specific functions, and accordingly utilities, of GAM493 correlate with, and may be deduced from, the identity of the target genes which GAM493 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6780] Nucleotide sequences of the GAM493 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM493 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM493 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM493 are further described hereinbelow with reference to Table 1.

[6781] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM493 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6782] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 494 (GAM494) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6783] GAM494 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM494 was detected is described hereinabove with reference to Figs. 2-8.

[6784] GAM494 gene, herein designated GAM GENE, and GAM494 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6785] GAM494 gene, herein designated GAM GENE, encodes a GAM494 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM494 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM494 precursor RNA is designated SEQ ID:471, and is provided hereinbelow with reference to the sequence listing part.

[6786] GAM494 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM494 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6787] An enzyme complex designated DICER COMPLEX, dices the GAM494 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM494 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM494 RNA is designated SEQ ID:3071, and is provided hereinbelow with reference to the sequence listing part.

[6788] GAM494 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM494 target RNA, herein designated

GAM TARGET RNA. GAM494 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6789] GAM494 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM494 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM494 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM494 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM494 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6790] The complementary binding of GAM494 RNA, herein designated GAM RNA, to target binding sites on GAM494 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM494 target RNA, herein designated GAM

TARGET RNA, into GAM494 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6791] It is appreciated that GAM494 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM494 target genes. The mRNA of each one of this plurality of GAM494 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM494 RNA, herein designated GAM RNA, and which when bound by GAM494 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM494 target proteins.

[6792] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM494 gene, herein designated GAM GENE, on one or more GAM494 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6793] It is yet further appreciated that specific functions, and accordingly utilities, of GAM494 correlate with, and may be deduced from, the identity of the target

genes which GAM494 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6794] Nucleotide sequences of the GAM494 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM494 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM494 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM494 are further described hereinbelow with reference to Table 1.

[6795] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM494 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6796] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 495 (GAM495) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6797] GAM495 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM495 was detected is described hereinabove with reference to Figs. 2-8.

[6798] GAM495 gene, herein designated GAM GENE, and GAM495 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[6799] GAM495 gene, herein designated GAM GENE, encodes a GAM495 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM495 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM495 precursor RNA is designated SEQ ID:472, and is provided hereinbelow with reference to the sequence listing part.

[6800] GAM495 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM495 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6801] An enzyme complex designated DICER COMPLEX, dices the GAM495 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM495 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM495 RNA is designated SEQ ID:3072, and is provided

hereinbelow with reference to the sequence listing part.

[6802] GAM495 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM495 target RNA, herein designated GAM TARGET RNA. GAM495 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6803] GAM495 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM495 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM495 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM495 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM495 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6804] The complementary binding of GAM495 RNA, herein designated GAM RNA, to target binding sites on GAM495 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM495 target RNA, herein designated GAM TARGET RNA, into GAM495 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6805] It is appreciated that GAM495 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM495 target genes. The mRNA of each one of this plurality of GAM495 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM495 RNA, herein designated GAM RNA, and which when bound by GAM495 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM495 target proteins.

[6806] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM495 gene, herein designated GAM GENE, on one or more GAM495 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6807] It is yet further appreciated that specific functions, and accordingly utilities, of GAM495 correlate with, and may be deduced from, the identity of the target genes which GAM495 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6808] Nucleotide sequences of the GAM495 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM495 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM495 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM495 are further described hereinbelow with reference to Table 1.

[6809] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM495 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6810] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 496 (GAM496) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6811] GAM496 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM496 was detected is

described hereinabove with reference to Figs. 2-8.

[6812] GAM496 gene, herein designated GAM GENE, and GAM496 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6813] GAM496 gene, herein designated GAM GENE, encodes a GAM496 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM496 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM496 precursor RNA is designated SEQ ID:473, and is provided hereinbelow with reference to the sequence listing part.

[6814] GAM496 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM496 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6815] An enzyme complex designated DICER COMPLEX, dices the GAM496 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM496 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM496 RNA is designated SEQ ID:3073, and is provided hereinbelow with reference to the sequence listing part.

[6816] GAM496 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM496 target RNA, herein designated GAM TARGET RNA. GAM496 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6817] GAM496 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM496 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM496 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM496 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM496 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6818] The complementary binding of GAM496 RNA, herein designated GAM RNA, to target binding sites on GAM496 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM496 target RNA, herein designated GAM TARGET RNA, into GAM496 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6819] It is appreciated that GAM496 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM496 target genes. The mRNA of each one of this plurality of GAM496 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM496 RNA, herein designated GAM RNA, and which when bound by GAM496 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM496 target proteins.

[6820] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM496 gene, herein designated GAM GENE, on one or more GAM496 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6821] It is yet further appreciated that specific functions, and accordingly utilities, of GAM496 correlate with, and may be deduced from, the identity of the target genes which GAM496 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6822] Nucleotide sequences of the GAM496 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM496 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM496 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM496 are further described hereinbelow with reference to Table 1.

[6823] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM496 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6824] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 497 (GAM497) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6825] GAM497 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM497 was detected is described hereinabove with reference to Figs. 2-8.

[6826] GAM497 gene, herein designated GAM GENE, and GAM497 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6827] GAM497 gene, herein designated GAM GENE, encodes a GAM497 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM497 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM497 precursor RNA is designated SEQ ID:474, and is provided hereinbelow with reference to the sequence listing part.

[6828] GAM497 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM497 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6829] An enzyme complex designated DICER COMPLEX, dices the GAM497 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM497 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM497 RNA is designated SEQ ID:3074, and is provided hereinbelow with reference to the sequence listing part.

[6830] GAM497 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM497 target RNA, herein designated GAM TARGET RNA. GAM497 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6831] GAM497 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM497 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM497 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM497 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM497 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6832] The complementary binding of GAM497 RNA, herein designated GAM RNA, to target binding sites on GAM497 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM497 target RNA, herein designated GAM TARGET RNA, into GAM497 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6833] It is appreciated that GAM497 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM497 target genes. The mRNA of each one of this plurality of GAM497 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM497 RNA, herein designated GAM RNA, and which when bound by GAM497 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM497 target proteins.

[6834] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM497 gene, herein designated GAM GENE, on one or more GAM497 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6835] It is yet further appreciated that specific functions, and accordingly utilities, of GAM497 correlate with, and may be deduced from, the identity of the target genes which GAM497 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6836] Nucleotide sequences of the GAM497 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM497 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM497 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM497 are further described hereinbelow with reference to Table 1.

[6837] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM497 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6838] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 498 (GAM498) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6839] GAM498 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM498 was detected is described hereinabove with reference to Figs. 2-8.

[6840] GAM498 gene, herein designated GAM GENE, and GAM498 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6841] GAM498 gene, herein designated GAM GENE, encodes a GAM498 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM498 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM498 precursor RNA is designated SEQ ID:475, and is provided hereinbelow with reference to the sequence listing part.

[6842] GAM498 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM498 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6843] An enzyme complex designated DICER COMPLEX, dices the GAM498 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM498 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM498 RNA is designated SEQ ID:3075, and is provided hereinbelow with reference to the sequence listing part.

[6844] GAM498 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM498 target RNA, herein designated GAM TARGET RNA. GAM498 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6845] GAM498 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM498 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM498 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM498 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM498 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6846] The complementary binding of GAM498 RNA, herein designated GAM RNA, to target binding sites on GAM498 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM498 target RNA, herein designated GAM TARGET RNA, into GAM498 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6847] It is appreciated that GAM498 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM498 target genes. The mRNA of each one of this plurality of GAM498 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM498 RNA, herein designated GAM RNA, and which when bound by GAM498 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM498 target proteins.

[6848] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM498 gene, herein designated GAM GENE, on one or more

GAM498 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6849] It is yet further appreciated that specific functions, and accordingly utilities, of GAM498 correlate with, and may be deduced from, the identity of the target genes which GAM498 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6850] Nucleotide sequences of the GAM498 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM498 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM498 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM498 are further described hereinbelow with reference to Table 1.

[6851] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM498 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6852] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 499 (GAM499) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6853] GAM499 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM499 was detected is described hereinabove with reference to Figs. 2-8.

[6854] GAM499 gene, herein designated GAM GENE, and GAM499 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6855] GAM499 gene, herein designated GAM GENE, encodes a GAM499 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM499 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM499 precursor RNA is designated SEQ ID:476, and is provided hereinbelow with reference to the sequence listing part.

[6856] GAM499 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM499 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6857] An enzyme complex designated DICER COMPLEX, dices the GAM499 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM499 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM499 RNA is designated SEQ ID:3076, and is provided hereinbelow with reference to the sequence listing part.

[6858] GAM499 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM499 target RNA, herein designated GAM TARGET RNA. GAM499 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6859] GAM499 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM499 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM499 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM499 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM499 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6860] The complementary binding of GAM499 RNA, herein designated GAM RNA, to target binding sites on GAM499 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM499 target RNA, herein designated GAM TARGET RNA, into GAM499 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6861] It is appreciated that GAM499 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM499 target genes. The mRNA of each one of this plurality of GAM499 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM499 RNA, herein designated GAM RNA, and which when bound by GAM499 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM499 target proteins.

[6862] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM499 gene, herein designated GAM GENE, on one or more GAM499 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6863] It is yet further appreciated that specific functions, and accordingly utilities, of GAM499 correlate with, and may be deduced from, the identity of the target genes which GAM499 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6864] Nucleotide sequences of the GAM499 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM499 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM499 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM499 are further described hereinbelow with reference to Table 1.

[6865] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM499 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6866] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 500 (GAM500) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6867] GAM500 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM500 was detected is described hereinabove with reference to Figs. 2-8.

[6868] GAM500 gene, herein designated GAM GENE, and GAM500 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6869] GAM500 gene, herein designated GAM GENE, encodes a GAM500 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM500 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM500 precursor RNA is designated SEQ ID:477, and is provided hereinbelow with reference to the sequence listing part.

[6870] GAM500 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM500 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6871] An enzyme complex designated DICER COMPLEX, dices the GAM500 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM500 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM500 RNA is designated SEQ ID:3077, and is provided hereinbelow with reference to the sequence listing part.

[6872] GAM500 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM500 target RNA, herein designated GAM TARGET RNA. GAM500 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6873] GAM500 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM500

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM500 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM500 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM500 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6874] The complementary binding of GAM500 RNA, herein designated GAM RNA, to target binding sites on GAM500 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM500 target RNA, herein designated GAM TARGET RNA, into GAM500 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6875] It is appreciated that GAM500 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM500 target genes. The mRNA of each one of this plurality of GAM500 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM500 RNA, herein designated GAM RNA, and which when bound by GAM500 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM500 target proteins.

[6876] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM500 gene, herein designated GAM GENE, on one or more GAM500 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6877] It is yet further appreciated that specific functions, and accordingly utilities, of GAM500 correlate with, and may be deduced from, the identity of the target genes which GAM500 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6878] Nucleotide sequences of the GAM500 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM500 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM500 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM500 are further described hereinbelow with

reference to Table 1.

[6879] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM500 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6880] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 501 (GAM501) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6881] GAM501 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM501 was detected is described hereinabove with reference to Figs. 2-8.

[6882] GAM501 gene, herein designated GAM GENE, and GAM501 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6883] GAM501 gene, herein designated GAM GENE, encodes a GAM501 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM501 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM501 precursor RNA is designated SEQ ID:478, and is provided

hereinbelow with reference to the sequence listing part.

[6884] GAM501 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM501 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6885] An enzyme complex designated DICER COMPLEX, dices the GAM501 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM501 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM501 RNA is designated SEQ ID:3078, and is provided hereinbelow with reference to the sequence listing part.

[6886] GAM501 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM501 target RNA, herein designated GAM TARGET RNA. GAM501 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[6887] GAM501 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM501 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM501 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM501 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM501 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6888] The complementary binding of GAM501 RNA, herein designated GAM RNA, to target binding sites on GAM501 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM501 target RNA, herein designated GAM TARGET RNA, into GAM501 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6889] It is appreciated that GAM501 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM501 target genes. The mRNA of each one of this plurality of GAM501 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM501 RNA, herein designated GAM RNA, and which when bound by GAM501 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM501 target proteins.

[6890] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM501 gene, herein designated GAM GENE, on one or more GAM501 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6891] It is yet further appreciated that specific functions, and accordingly utilities, of GAM501 correlate with, and may be deduced from, the identity of the target genes which GAM501 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6892] Nucleotide sequences of the GAM501 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM501 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM501 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM501 are further described hereinbelow with reference to Table 1.

[6893] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM501 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6894] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 502 (GAM502) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6895] GAM502 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM502 was detected is described hereinabove with reference to Figs. 2-8.

[6896] GAM502 gene, herein designated GAM GENE, and GAM502 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6897] GAM502 gene, herein designated GAM GENE, encodes a GAM502 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM502 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM502 precursor RNA is designated SEQ ID:479, and is provided hereinbelow with reference to the sequence listing part.

[6898] GAM502 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM502 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6899] An enzyme complex designated DICER COMPLEX, dices the GAM502 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM502 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM502 RNA is designated SEQ ID:3079, and is provided hereinbelow with reference to the sequence listing part.

[6900] GAM502 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM502 target RNA, herein designated

GAM TARGET RNA. GAM502 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6901] GAM502 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM502 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM502 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM502 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM502 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6902] The complementary binding of GAM502 RNA, herein designated GAM RNA, to target binding sites on GAM502 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM502 target RNA, herein designated GAM

TARGET RNA, into GAM502 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6903] It is appreciated that GAM502 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM502 target genes. The mRNA of each one of this plurality of GAM502 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM502 RNA, herein designated GAM RNA, and which when bound by GAM502 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM502 target proteins.

[6904] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM502 gene, herein designated GAM GENE, on one or more GAM502 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6905] It is yet further appreciated that specific functions, and accordingly utilities, of GAM502 correlate with, and may be deduced from, the identity of the target

genes which GAM502 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6906] Nucleotide sequences of the GAM502 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM502 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM502 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM502 are further described hereinbelow with reference to Table 1.

[6907] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM502 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6908] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 503 (GAM503) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6909] GAM503 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM503 was detected is described hereinabove with reference to Figs. 2-8.

[6910] GAM503 gene, herein designated GAM GENE, and GAM503 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[6911] GAM503 gene, herein designated GAM GENE, encodes a GAM503 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM503 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM503 precursor RNA is designated SEQ ID:480, and is provided hereinbelow with reference to the sequence listing part.

[6912] GAM503 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM503 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6913] An enzyme complex designated DICER COMPLEX, dices the GAM503 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM503 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM503 RNA is designated SEQ ID:3080, and is provided

hereinbelow with reference to the sequence listing part.

[6914] GAM503 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM503 target RNA, herein designated GAM TARGET RNA. GAM503 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6915] GAM503 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM503 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM503 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM503 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM503 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6916] The complementary binding of GAM503 RNA, herein designated GAM RNA, to target binding sites on GAM503 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM503 target RNA, herein designated GAM TARGET RNA, into GAM503 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6917] It is appreciated that GAM503 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM503 target genes. The mRNA of each one of this plurality of GAM503 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM503 RNA, herein designated GAM RNA, and which when bound by GAM503 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM503 target proteins.

[6918] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM503 gene, herein designated GAM GENE, on one or more GAM503 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6919] It is yet further appreciated that specific functions, and accordingly utilities, of GAM503 correlate with, and may be deduced from, the identity of the target genes which GAM503 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6920] Nucleotide sequences of the GAM503 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM503 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM503 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM503 are further described hereinbelow with reference to Table 1.

[6921] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM503 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6922] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 504 (GAM504) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6923] GAM504 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM504 was detected is

described hereinabove with reference to Figs. 2-8.

[6924] GAM504 gene, herein designated GAM GENE, and GAM504 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6925] GAM504 gene, herein designated GAM GENE, encodes a GAM504 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM504 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM504 precursor RNA is designated SEQ ID:481, and is provided hereinbelow with reference to the sequence listing part.

[6926] GAM504 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM504 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6927] An enzyme complex designated DICER COMPLEX, dices the GAM504 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM504 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM504 RNA is designated SEQ ID:3081, and is provided hereinbelow with reference to the sequence listing part.

[6928] GAM504 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM504 target RNA, herein designated GAM TARGET RNA. GAM504 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6929] GAM504 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM504 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM504 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM504 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM504 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6930] The complementary binding of GAM504 RNA, herein designated GAM RNA, to target binding sites on GAM504 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM504 target RNA, herein designated GAM TARGET RNA, into GAM504 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6931] It is appreciated that GAM504 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM504 target genes. The mRNA of each one of this plurality of GAM504 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM504 RNA, herein designated GAM RNA, and which when bound by GAM504 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM504 target proteins.

[6932] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM504 gene, herein designated GAM GENE, on one or more GAM504 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6933] It is yet further appreciated that specific functions, and accordingly utilities, of GAM504 correlate with, and may be deduced from, the identity of the target genes which GAM504 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6934] Nucleotide sequences of the GAM504 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM504 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM504 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM504 are further described hereinbelow with reference to Table 1.

[6935] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM504 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6936] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 505 (GAM505) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6937] GAM505 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM505 was detected is described hereinabove with reference to Figs. 2-8.

[6938] GAM505 gene, herein designated GAM GENE, and GAM505 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6939] GAM505 gene, herein designated GAM GENE, encodes a GAM505 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM505 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM505 precursor RNA is designated SEQ ID:482, and is provided hereinbelow with reference to the sequence listing part.

[6940] GAM505 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM505 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6941] An enzyme complex designated DICER COMPLEX, dices the GAM505 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM505 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM505 RNA is designated SEQ ID:3083, and is provided hereinbelow with reference to the sequence listing part.

[6942] GAM505 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM505 target RNA, herein designated GAM TARGET RNA. GAM505 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6943] GAM505 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM505 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM505 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM505 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM505 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6944] The complementary binding of GAM505 RNA, herein designated GAM RNA, to target binding sites on GAM505 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM505 target RNA, herein designated GAM TARGET RNA, into GAM505 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6945] It is appreciated that GAM505 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM505 target genes. The mRNA of each one of this plurality of GAM505 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM505 RNA, herein designated GAM RNA, and which when bound by GAM505 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM505 target proteins.

[6946] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM505 gene, herein designated GAM GENE, on one or more GAM505 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6947] It is yet further appreciated that specific functions, and accordingly utilities, of GAM505 correlate with, and may be deduced from, the identity of the target genes which GAM505 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6948] Nucleotide sequences of the GAM505 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM505 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM505 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM505 are further described hereinbelow with reference to Table 1.

[6949] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM505 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6950] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 506 (GAM506) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6951] GAM506 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM506 was detected is described hereinabove with reference to Figs. 2-8.

[6952] GAM506 gene, herein designated GAM GENE, and GAM506 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6953] GAM506 gene, herein designated GAM GENE, encodes a GAM506 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM506 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM506 precursor RNA is designated SEQ ID:483, and is provided hereinbelow with reference to the sequence listing part.

[6954] GAM506 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM506 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6955] An enzyme complex designated DICER COMPLEX, dices the GAM506 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM506 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM506 RNA is designated SEQ ID:3082, and is provided hereinbelow with reference to the sequence listing part.

[6956] GAM506 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM506 target RNA, herein designated GAM TARGET RNA. GAM506 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6957] GAM506 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM506 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM506 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM506 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM506 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6958] The complementary binding of GAM506 RNA, herein designated GAM RNA, to target binding sites on GAM506 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM506 target RNA, herein designated GAM TARGET RNA, into GAM506 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6959] It is appreciated that GAM506 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM506 target genes. The mRNA of each one of this plurality of GAM506 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM506 RNA, herein designated GAM RNA, and which when bound by GAM506 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM506 target proteins.

[6960] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM506 gene, herein designated GAM GENE, on one or more

GAM506 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6961] It is yet further appreciated that specific functions, and accordingly utilities, of GAM506 correlate with, and may be deduced from, the identity of the target genes which GAM506 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6962] Nucleotide sequences of the GAM506 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM506 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM506 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM506 are further described hereinbelow with reference to Table 1.

[6963] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM506 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6964] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 507 (GAM507) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6965] GAM507 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM507 was detected is described hereinabove with reference to Figs. 2-8.

[6966] GAM507 gene, herein designated GAM GENE, and GAM507 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6967] GAM507 gene, herein designated GAM GENE, encodes a GAM507 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM507 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM507 precursor RNA is designated SEQ ID:484, and is provided hereinbelow with reference to the sequence listing part.

[6968] GAM507 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM507 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6969] An enzyme complex designated DICER COMPLEX, dices the GAM507 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM507 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM507 RNA is designated SEQ ID:3084, and is provided hereinbelow with reference to the sequence listing part.

[6970] GAM507 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM507 target RNA, herein designated GAM TARGET RNA. GAM507 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6971] GAM507 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM507 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM507 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM507 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM507 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6972] The complementary binding of GAM507 RNA, herein designated GAM RNA, to target binding sites on GAM507 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM507 target RNA, herein designated GAM TARGET RNA, into GAM507 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6973] It is appreciated that GAM507 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM507 target genes. The mRNA of each one of this plurality of GAM507 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM507 RNA, herein designated GAM RNA, and which when bound by GAM507 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM507 target proteins.

[6974] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM507 gene, herein designated GAM GENE, on one or more GAM507 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6975] It is yet further appreciated that specific functions, and accordingly utilities, of GAM507 correlate with, and may be deduced from, the identity of the target genes which GAM507 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6976] Nucleotide sequences of the GAM507 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM507 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM507 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM507 are further described hereinbelow with reference to Table 1.

[6977] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM507 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6978] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 508 (GAM508) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6979] GAM508 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM508 was detected is described hereinabove with reference to Figs. 2-8.

[6980] GAM508 gene, herein designated GAM GENE, and GAM508 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6981] GAM508 gene, herein designated GAM GENE, encodes a GAM508 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM508 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM508 precursor RNA is designated SEQ ID:485, and is provided hereinbelow with reference to the sequence listing part.

[6982] GAM508 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM508 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6983] An enzyme complex designated DICER COMPLEX, dices the GAM508 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM508 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM508 RNA is designated SEQ ID:3085, and is provided hereinbelow with reference to the sequence listing part.

[6984] GAM508 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM508 target RNA, herein designated GAM TARGET RNA. GAM508 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[6985] GAM508 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM508

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM508 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM508 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM508 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[6986] The complementary binding of GAM508 RNA, herein designated GAM RNA, to target binding sites on GAM508 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM508 target RNA, herein designated GAM TARGET RNA, into GAM508 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[6987] It is appreciated that GAM508 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM508 target genes. The mRNA of each one of this plurality of GAM508 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM508 RNA, herein designated GAM RNA, and which when bound by GAM508 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM508 target proteins.

[6988] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM508 gene, herein designated GAM GENE, on one or more GAM508 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[6989] It is yet further appreciated that specific functions, and accordingly utilities, of GAM508 correlate with, and may be deduced from, the identity of the target genes which GAM508 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6990] Nucleotide sequences of the GAM508 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM508 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM508 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM508 are further described hereinbelow with

reference to Table 1.

[6991] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM508 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[6992] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 509 (GAM509) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[6993] GAM509 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM509 was detected is described hereinabove with reference to Figs. 2-8.

[6994] GAM509 gene, herein designated GAM GENE, and GAM509 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[6995] GAM509 gene, herein designated GAM GENE, encodes a GAM509 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM509 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM509 precursor RNA is designated SEQ ID:486, and is provided

hereinbelow with reference to the sequence listing part.

[6996] GAM509 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM509 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6997] An enzyme complex designated DICER COMPLEX, dices the GAM509 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM509 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM509 RNA is designated SEQ ID:3086, and is provided hereinbelow with reference to the sequence listing part.

[6998] GAM509 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM509 target RNA, herein designated GAM TARGET RNA. GAM509 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[6999] GAM509 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM509 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM509 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM509 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM509 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7000] The complementary binding of GAM509 RNA, herein designated GAM RNA, to target binding sites on GAM509 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM509 target RNA, herein designated GAM TARGET RNA, into GAM509 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7001] It is appreciated that GAM509 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM509 target genes. The mRNA of each one of this plurality of GAM509 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM509 RNA, herein designated GAM RNA, and which when bound by GAM509 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM509 target proteins.

[7002] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM509 gene, herein designated GAM GENE, on one or more GAM509 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7003] It is yet further appreciated that specific functions, and accordingly utilities, of GAM509 correlate with, and may be deduced from, the identity of the target genes which GAM509 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7004] Nucleotide sequences of the GAM509 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM509 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM509 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM509 are further described hereinbelow with reference to Table 1.

[7005] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM509 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7006] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 510 (GAM510) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7007] GAM510 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM510 was detected is described hereinabove with reference to Figs. 2-8.

[7008] GAM510 gene, herein designated GAM GENE, and GAM510 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7009] GAM510 gene, herein designated GAM GENE, encodes a GAM510 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM510 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM510 precursor RNA is designated SEQ ID:487, and is provided hereinbelow with reference to the sequence listing part.

[7010] GAM510 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM510 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7011] An enzyme complex designated DICER COMPLEX, dices the GAM510 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM510 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM510 RNA is designated SEQ ID:3087, and is provided hereinbelow with reference to the sequence listing part.

[7012] GAM510 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM510 target RNA, herein designated

GAM TARGET RNA. GAM510 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7013] GAM510 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM510 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM510 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM510 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM510 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7014] The complementary binding of GAM510 RNA, herein designated GAM RNA, to target binding sites on GAM510 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM510 target RNA, herein designated GAM

TARGET RNA, into GAM510 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7015] It is appreciated that GAM510 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM510 target genes. The mRNA of each one of this plurality of GAM510 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM510 RNA, herein designated GAM RNA, and which when bound by GAM510 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM510 target proteins.

[7016] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM510 gene, herein designated GAM GENE, on one or more GAM510 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7017] It is yet further appreciated that specific functions, and accordingly utilities, of GAM510 correlate with, and may be deduced from, the identity of the target

genes which GAM510 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7018] Nucleotide sequences of the GAM510 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM510 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM510 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM510 are further described hereinbelow with reference to Table 1.

[7019] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM510 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7020] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 511 (GAM511) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7021] GAM511 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM511 was detected is described hereinabove with reference to Figs. 2-8.

[7022] GAM511 gene, herein designated GAM GENE, and GAM511 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[7023] GAM511 gene, herein designated GAM GENE, encodes a GAM511 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM511 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM511 precursor RNA is designated SEQ ID:488, and is provided hereinbelow with reference to the sequence listing part.

[7024] GAM511 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM511 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7025] An enzyme complex designated DICER COMPLEX, dices the GAM511 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM511 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM511 RNA is designated SEQ ID:3088, and is provided

hereinbelow with reference to the sequence listing part.

[7026] GAM511 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM511 target RNA, herein designated GAM TARGET RNA. GAM511 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7027] GAM511 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM511 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM511 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM511 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM511 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7028] The complementary binding of GAM511 RNA, herein designated GAM RNA, to target binding sites on GAM511 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM511 target RNA, herein designated GAM TARGET RNA, into GAM511 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7029] It is appreciated that GAM511 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM511 target genes. The mRNA of each one of this plurality of GAM511 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM511 RNA, herein designated GAM RNA, and which when bound by GAM511 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM511 target proteins.

[7030] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM511 gene, herein designated GAM GENE, on one or more GAM511 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7031] It is yet further appreciated that specific functions, and accordingly utilities, of GAM511 correlate with, and may be deduced from, the identity of the target genes which GAM511 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7032] Nucleotide sequences of the GAM511 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM511 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM511 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM511 are further described hereinbelow with reference to Table 1.

[7033] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM511 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7034] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 512 (GAM512) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7035] GAM512 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM512 was detected is

described hereinabove with reference to Figs. 2-8.

[7036] GAM512 gene, herein designated GAM GENE, and GAM512 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7037] GAM512 gene, herein designated GAM GENE, encodes a GAM512 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM512 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM512 precursor RNA is designated SEQ ID:489, and is provided hereinbelow with reference to the sequence listing part.

[7038] GAM512 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM512 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7039] An enzyme complex designated DICER COMPLEX, dices the GAM512 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM512 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM512 RNA is designated SEQ ID:3089, and is provided hereinbelow with reference to the sequence listing part.

[7040] GAM512 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM512 target RNA, herein designated GAM TARGET RNA. GAM512 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7041] GAM512 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM512 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM512 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM512 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM512 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7042] The complementary binding of GAM512 RNA, herein designated GAM RNA, to target binding sites on GAM512 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM512 target RNA, herein designated GAM TARGET RNA, into GAM512 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7043] It is appreciated that GAM512 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM512 target genes. The mRNA of each one of this plurality of GAM512 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM512 RNA, herein designated GAM RNA, and which when bound by GAM512 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM512 target proteins.

[7044] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM512 gene, herein designated GAM GENE, on one or more GAM512 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7045] It is yet further appreciated that specific functions, and accordingly utilities, of GAM512 correlate with, and may be deduced from, the identity of the target genes which GAM512 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7046] Nucleotide sequences of the GAM512 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM512 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM512 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM512 are further described hereinbelow with reference to Table 1.

[7047] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM512 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7048] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 513 (GAM513) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7049] GAM513 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM513 was detected is described hereinabove with reference to Figs. 2-8.

[7050] GAM513 gene, herein designated GAM GENE, and GAM513 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7051] GAM513 gene, herein designated GAM GENE, encodes a GAM513 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM513 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM513 precursor RNA is designated SEQ ID:490, and is provided hereinbelow with reference to the sequence listing part.

[7052] GAM513 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM513 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7053] An enzyme complex designated DICER COMPLEX, dices the GAM513 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM513 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM513 RNA is designated SEQ ID:3090, and is provided hereinbelow with reference to the sequence listing part.

[7054] GAM513 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM513 target RNA, herein designated GAM TARGET RNA. GAM513 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7055] GAM513 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM513 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM513 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM513 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM513 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7056] The complementary binding of GAM513 RNA, herein designated GAM RNA, to target binding sites on GAM513 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM513 target RNA, herein designated GAM TARGET RNA, into GAM513 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7057] It is appreciated that GAM513 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM513 target genes. The mRNA of each one of this plurality of GAM513 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM513 RNA, herein designated GAM RNA, and which when bound by GAM513 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM513 target proteins.

[7058] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM513 gene, herein designated GAM GENE, on one or more GAM513 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7059] It is yet further appreciated that specific functions, and accordingly utilities, of GAM513 correlate with, and may be deduced from, the identity of the target genes which GAM513 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7060] Nucleotide sequences of the GAM513 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM513 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM513 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM513 are further described hereinbelow with reference to Table 1.

[7061] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM513 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7062] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 514 (GAM514) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7063] GAM514 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM514 was detected is described hereinabove with reference to Figs. 2-8.

[7064] GAM514 gene, herein designated GAM GENE, and GAM514 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7065] GAM514 gene, herein designated GAM GENE, encodes a GAM514 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM514 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM514 precursor RNA is designated SEQ ID:491, and is provided hereinbelow with reference to the sequence listing part.

[7066] GAM514 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM514 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7067] An enzyme complex designated DICER COMPLEX, dices the GAM514 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM514 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM514 RNA is designated SEQ ID:3091, and is provided hereinbelow with reference to the sequence listing part.

[7068] GAM514 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM514 target RNA, herein designated GAM TARGET RNA. GAM514 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7069] GAM514 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM514 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM514 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM514 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM514 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7070] The complementary binding of GAM514 RNA, herein designated GAM RNA, to target binding sites on GAM514 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM514 target RNA, herein designated GAM TARGET RNA, into GAM514 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7071] It is appreciated that GAM514 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM514 target genes. The mRNA of each one of this plurality of GAM514 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM514 RNA, herein designated GAM RNA, and which when bound by GAM514 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM514 target proteins.

[7072] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM514 gene, herein designated GAM GENE, on one or more

GAM514 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7073] It is yet further appreciated that specific functions, and accordingly utilities, of GAM514 correlate with, and may be deduced from, the identity of the target genes which GAM514 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7074] Nucleotide sequences of the GAM514 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM514 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM514 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM514 are further described hereinbelow with reference to Table 1.

[7075] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM514 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7076] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 515 (GAM515) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7077] GAM515 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM515 was detected is described hereinabove with reference to Figs. 2-8.

[7078] GAM515 gene, herein designated GAM GENE, and GAM515 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7079] GAM515 gene, herein designated GAM GENE, encodes a GAM515 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM515 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM515 precursor RNA is designated SEQ ID:492, and is provided hereinbelow with reference to the sequence listing part.

[7080] GAM515 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM515 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7081] An enzyme complex designated DICER COMPLEX, dices the GAM515 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM515 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM515 RNA is designated SEQ ID:3092, and is provided hereinbelow with reference to the sequence listing part.

[7082] GAM515 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM515 target RNA, herein designated GAM TARGET RNA. GAM515 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7083] GAM515 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM515 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM515 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM515 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM515 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7084] The complementary binding of GAM515 RNA, herein designated GAM RNA, to target binding sites on GAM515 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM515 target RNA, herein designated GAM TARGET RNA, into GAM515 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7085] It is appreciated that GAM515 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM515 target genes. The mRNA of each one of this plurality of GAM515 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM515 RNA, herein designated GAM RNA, and which when bound by GAM515 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM515 target proteins.

[7086] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM515 gene, herein designated GAM GENE, on one or more GAM515 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7087] It is yet further appreciated that specific functions, and accordingly utilities, of GAM515 correlate with, and may be deduced from, the identity of the target genes which GAM515 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7088] Nucleotide sequences of the GAM515 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM515 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM515 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM515 are further described hereinbelow with reference to Table 1.

[7089] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM515 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7090] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 516 (GAM516) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7091] GAM516 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM516 was detected is described hereinabove with reference to Figs. 2-8.

[7092] GAM516 gene, herein designated GAM GENE, and GAM516 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7093] GAM516 gene, herein designated GAM GENE, encodes a GAM516 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM516 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM516 precursor RNA is designated SEQ ID:493, and is provided hereinbelow with reference to the sequence listing part.

[7094] GAM516 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM516 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7095] An enzyme complex designated DICER COMPLEX, dices the GAM516 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM516 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM516 RNA is designated SEQ ID:3093, and is provided hereinbelow with reference to the sequence listing part.

[7096] GAM516 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM516 target RNA, herein designated GAM TARGET RNA. GAM516 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7097] GAM516 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM516

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM516 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM516 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM516 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7098] The complementary binding of GAM516 RNA, herein designated GAM RNA, to target binding sites on GAM516 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM516 target RNA, herein designated GAM TARGET RNA, into GAM516 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7099] It is appreciated that GAM516 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM516 target genes. The mRNA of each one of this plurality of GAM516 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM516 RNA, herein designated GAM RNA, and which when bound by GAM516 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM516 target proteins.

[7100] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM516 gene, herein designated GAM GENE, on one or more GAM516 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7101] It is yet further appreciated that specific functions, and accordingly utilities, of GAM516 correlate with, and may be deduced from, the identity of the target genes which GAM516 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7102] Nucleotide sequences of the GAM516 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM516 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM516 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM516 are further described hereinbelow with

reference to Table 1.

[7103] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM516 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7104] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 517 (GAM517) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7105] GAM517 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM517 was detected is described hereinabove with reference to Figs. 2-8.

[7106] GAM517 gene, herein designated GAM GENE, and GAM517 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7107] GAM517 gene, herein designated GAM GENE, encodes a GAM517 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM517 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM517 precursor RNA is designated SEQ ID:494, and is provided

hereinbelow with reference to the sequence listing part.

[7108] GAM517 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM517 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7109] An enzyme complex designated DICER COMPLEX, dices the GAM517 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM517 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM517 RNA is designated SEQ ID:3094, and is provided hereinbelow with reference to the sequence listing part.

[7110] GAM517 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM517 target RNA, herein designated GAM TARGET RNA. GAM517 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[7111] GAM517 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM517 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM517 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM517 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM517 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7112] The complementary binding of GAM517 RNA, herein designated GAM RNA, to target binding sites on GAM517 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM517 target RNA, herein designated GAM TARGET RNA, into GAM517 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7113] It is appreciated that GAM517 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM517 target genes. The mRNA of each one of this plurality of GAM517 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM517 RNA, herein designated GAM RNA, and which when bound by GAM517 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM517 target proteins.

[7114] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM517 gene, herein designated GAM GENE, on one or more GAM517 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7115] It is yet further appreciated that specific functions, and accordingly utilities, of GAM517 correlate with, and may be deduced from, the identity of the target genes which GAM517 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7116] Nucleotide sequences of the GAM517 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM517 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM517 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM517 are further described hereinbelow with reference to Table 1.

[7117] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM517 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7118] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 518 (GAM518) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7119] GAM518 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM518 was detected is described hereinabove with reference to Figs. 2-8.

[7120] GAM518 gene, herein designated GAM GENE, and GAM518 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7121] GAM518 gene, herein designated GAM GENE, encodes a GAM518 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM518 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM518 precursor RNA is designated SEQ ID:495, and is provided hereinbelow with reference to the sequence listing part.

[7122] GAM518 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM518 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7123] An enzyme complex designated DICER COMPLEX, dices the GAM518 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM518 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM518 RNA is designated SEQ ID:3095, and is provided hereinbelow with reference to the sequence listing part.

[7124] GAM518 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM518 target RNA, herein designated

GAM TARGET RNA. GAM518 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7125] GAM518 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM518 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM518 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM518 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM518 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7126] The complementary binding of GAM518 RNA, herein designated GAM RNA, to target binding sites on GAM518 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM518 target RNA, herein designated GAM

TARGET RNA, into GAM518 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7127] It is appreciated that GAM518 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM518 target genes. The mRNA of each one of this plurality of GAM518 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM518 RNA, herein designated GAM RNA, and which when bound by GAM518 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM518 target proteins.

[7128] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM518 gene, herein designated GAM GENE, on one or more GAM518 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7129] It is yet further appreciated that specific functions, and accordingly utilities, of GAM518 correlate with, and may be deduced from, the identity of the target

genes which GAM518 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7130] Nucleotide sequences of the GAM518 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM518 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM518 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM518 are further described hereinbelow with reference to Table 1.

[7131] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM518 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7132] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 519 (GAM519) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7133] GAM519 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM519 was detected is described hereinabove with reference to Figs. 2-8.

[7134] GAM519 gene, herein designated GAM GENE, and GAM519 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[7135] GAM519 gene, herein designated GAM GENE, encodes a GAM519 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM519 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM519 precursor RNA is designated SEQ ID:496, and is provided hereinbelow with reference to the sequence listing part.

[7136] GAM519 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM519 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7137] An enzyme complex designated DICER COMPLEX, dices the GAM519 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM519 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM519 RNA is designated SEQ ID:3096, and is provided

hereinbelow with reference to the sequence listing part.

[7138] GAM519 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM519 target RNA, herein designated GAM TARGET RNA. GAM519 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7139] GAM519 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM519 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM519 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM519 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM519 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7140] The complementary binding of GAM519 RNA, herein designated GAM RNA, to target binding sites on GAM519 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM519 target RNA, herein designated GAM TARGET RNA, into GAM519 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7141] It is appreciated that GAM519 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM519 target genes. The mRNA of each one of this plurality of GAM519 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM519 RNA, herein designated GAM RNA, and which when bound by GAM519 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM519 target proteins.

[7142] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM519 gene, herein designated GAM GENE, on one or more GAM519 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7143] It is yet further appreciated that specific functions, and accordingly utilities, of GAM519 correlate with, and may be deduced from, the identity of the target genes which GAM519 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7144] Nucleotide sequences of the GAM519 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM519 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM519 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM519 are further described hereinbelow with reference to Table 1.

[7145] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM519 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7146] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 520 (GAM520) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7147] GAM520 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM520 was detected is

described hereinabove with reference to Figs. 2-8.

[7148] GAM520 gene, herein designated GAM GENE, and GAM520 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7149] GAM520 gene, herein designated GAM GENE, encodes a GAM520 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM520 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM520 precursor RNA is designated SEQ ID:497, and is provided hereinbelow with reference to the sequence listing part.

[7150] GAM520 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7151] An enzyme complex designated DICER COMPLEX, dices the GAM520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM520 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM520 RNA is designated SEQ ID:3097, and is provided hereinbelow with reference to the sequence listing part.

[7152] GAM520 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM520 target RNA, herein designated GAM TARGET RNA. GAM520 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7153] GAM520 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM520 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM520 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM520 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM520 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7154] The complementary binding of GAM520 RNA, herein designated GAM RNA, to target binding sites on GAM520 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM520 target RNA, herein designated GAM TARGET RNA, into GAM520 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7155] It is appreciated that GAM520 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM520 target genes. The mRNA of each one of this plurality of GAM520 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM520 RNA, herein designated GAM RNA, and which when bound by GAM520 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM520 target proteins.

[7156] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM520 gene, herein designated GAM GENE, on one or more GAM520 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7157] It is yet further appreciated that specific functions, and accordingly utilities, of GAM520 correlate with, and may be deduced from, the identity of the target genes which GAM520 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7158] Nucleotide sequences of the GAM520 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM520 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM520 are further described hereinbelow with reference to Table 1.

[7159] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM520 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7160] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 521 (GAM521) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7161] GAM521 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM521 was detected is described hereinabove with reference to Figs. 2-8.

[7162] GAM521 gene, herein designated GAM GENE, and GAM521 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7163] GAM521 gene, herein designated GAM GENE, encodes a GAM521 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM521 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM521 precursor RNA is designated SEQ ID:498, and is provided hereinbelow with reference to the sequence listing part.

[7164] GAM521 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM521 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7165] An enzyme complex designated DICER COMPLEX, dices the GAM521 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM521 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM521 RNA is designated SEQ ID:3098, and is provided hereinbelow with reference to the sequence listing part.

[7166] GAM521 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM521 target RNA, herein designated GAM TARGET RNA. GAM521 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7167] GAM521 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM521 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM521 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM521 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM521 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7168] The complementary binding of GAM521 RNA, herein designated GAM RNA, to target binding sites on GAM521 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM521 target RNA, herein designated GAM TARGET RNA, into GAM521 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7169] It is appreciated that GAM521 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM521 target genes. The mRNA of

each one of this plurality of GAM521 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM521 RNA, herein designated GAM RNA, and which when bound by GAM521 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM521 target proteins.

[7170] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM521 gene, herein designated GAM GENE, on one or more GAM521 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7171] It is yet further appreciated that specific functions, and accordingly utilities, of GAM521 correlate with, and may be deduced from, the identity of the target genes which GAM521 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7172] Nucleotide sequences of the GAM521 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM521 RNA, herein designated GAM RNA, and a schematic representation of the secondary

folding of GAM521 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM521 are further described hereinbelow with reference to Table 1.

[7173] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM521 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7174] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 522 (GAM522) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7175] GAM522 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM522 was detected is described hereinabove with reference to Figs. 2-8.

[7176] GAM522 gene, herein designated GAM GENE, and GAM522 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7177] GAM522 gene, herein designated GAM GENE, encodes a GAM522 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM522 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of GAM522 precursor RNA is designated SEQ ID:499, and is provided hereinbelow with reference to the sequence listing part.

[7178] GAM522 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM522 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7179] An enzyme complex designated DICER COMPLEX, dices the GAM522 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM522 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM522 RNA is designated SEQ ID:3099, and is provided hereinbelow with reference to the sequence listing part.

[7180] GAM522 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM522 target RNA, herein designated GAM TARGET RNA. GAM522 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein

coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7181] GAM522 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM522 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM522 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM522 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM522 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7182] The complementary binding of GAM522 RNA, herein designated GAM RNA, to target binding sites on GAM522 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM522 target RNA, herein designated GAM TARGET RNA, into GAM522 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken

line.

[7183] It is appreciated that GAM522 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM522 target genes. The mRNA of each one of this plurality of GAM522 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM522 RNA, herein designated GAM RNA, and which when bound by GAM522 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM522 target proteins.

[7184] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM522 gene, herein designated GAM GENE, on one or more GAM522 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7185] It is yet further appreciated that specific functions, and accordingly utilities, of GAM522 correlate with, and may be deduced from, the identity of the target genes which GAM522 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7186] Nucleotide sequences of the GAM522 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM522 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM522 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM522 are further described hereinbelow with reference to Table 1.

[7187] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM522 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7188] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 523 (GAM523) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7189] GAM523 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM523 was detected is described hereinabove with reference to Figs. 2-8.

[7190] GAM523 gene, herein designated GAM GENE, and GAM523 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7191] GAM523 gene, herein designated GAM GENE, encodes a GAM523

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM523 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM523 precursor RNA is designated SEQ ID:500, and is provided hereinbelow with reference to the sequence listing part.

[7192] GAM523 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM523 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7193] An enzyme complex designated DICER COMPLEX, dices the GAM523 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM523 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM523 RNA is designated SEQ ID:3100, and is provided hereinbelow with reference to the sequence listing part.

[7194] GAM523 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM523 target RNA, herein designated GAM TARGET RNA. GAM523 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7195] GAM523 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM523 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM523 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM523 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM523 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7196] The complementary binding of GAM523 RNA, herein designated GAM RNA, to target binding sites on GAM523 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING

SITE III, inhibits translation of GAM523 target RNA, herein designated GAM TARGET RNA, into GAM523 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7197] It is appreciated that GAM523 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM523 target genes. The mRNA of each one of this plurality of GAM523 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM523 RNA, herein designated GAM RNA, and which when bound by GAM523 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM523 target proteins.

[7198] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM523 gene, herein designated GAM GENE, on one or more GAM523 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7199] It is yet further appreciated that specific functions, and accordingly utilities, of

GAM523 correlate with, and may be deduced from, the identity of the target genes which GAM523 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7200] Nucleotide sequences of the GAM523 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM523 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM523 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM523 are further described hereinbelow with reference to Table 1.

[7201] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM523 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7202] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 524 (GAM524) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7203] GAM524 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM524 was detected is described hereinabove with reference to Figs. 2-8.

[7204] GAM524 gene, herein designated GAM GENE, and GAM524 target gene,

herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7205] GAM524 gene, herein designated GAM GENE, encodes a GAM524 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM524 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM524 precursor RNA is designated SEQ ID:501, and is provided hereinbelow with reference to the sequence listing part.

[7206] GAM524 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM524 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7207] An enzyme complex designated DICER COMPLEX, dices the GAM524 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM524 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide

sequence of GAM524 RNA is designated SEQ ID:3101, and is provided hereinbelow with reference to the sequence listing part.

[7208] GAM524 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM524 target RNA, herein designated GAM TARGET RNA. GAM524 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7209] GAM524 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM524 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM524 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM524 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM524 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7210] The complementary binding of GAM524 RNA, herein designated GAM RNA, to target binding sites on GAM524 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM524 target RNA, herein designated GAM TARGET RNA, into GAM524 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7211] It is appreciated that GAM524 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM524 target genes. The mRNA of each one of this plurality of GAM524 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM524 RNA, herein designated GAM RNA, and which when bound by GAM524 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM524 target proteins.

[7212] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM524 gene, herein designated GAM GENE, on one or more GAM524 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7213] It is yet further appreciated that specific functions, and accordingly utilities, of GAM524 correlate with, and may be deduced from, the identity of the target genes which GAM524 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7214] Nucleotide sequences of the GAM524 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM524 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM524 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM524 are further described hereinbelow with reference to Table 1.

[7215] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM524 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7216] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 525 (GAM525) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7217] GAM525 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM525 was detected is

described hereinabove with reference to Figs. 2-8.

[7218] GAM525 gene, herein designated GAM GENE, and GAM525 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7219] GAM525 gene, herein designated GAM GENE, encodes a GAM525 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM525 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM525 precursor RNA is designated SEQ ID:502, and is provided hereinbelow with reference to the sequence listing part.

[7220] GAM525 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM525 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7221] An enzyme complex designated DICER COMPLEX, dices the GAM525 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM525 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM525 RNA is designated SEQ ID:3102, and is provided hereinbelow with reference to the sequence listing part.

[7222] GAM525 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM525 target RNA, herein designated GAM TARGET RNA. GAM525 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7223] GAM525 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM525 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM525 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM525 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM525 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7224] The complementary binding of GAM525 RNA, herein designated GAM RNA, to target binding sites on GAM525 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM525 target RNA, herein designated GAM TARGET RNA, into GAM525 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7225] It is appreciated that GAM525 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM525 target genes. The mRNA of each one of this plurality of GAM525 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM525 RNA, herein designated GAM RNA, and which when bound by GAM525 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM525 target proteins.

[7226] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM525 gene, herein designated GAM GENE, on one or more GAM525 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7227] It is yet further appreciated that specific functions, and accordingly utilities, of GAM525 correlate with, and may be deduced from, the identity of the target genes which GAM525 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7228] Nucleotide sequences of the GAM525 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM525 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM525 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM525 are further described hereinbelow with reference to Table 1.

[7229] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM525 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7230] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 526 (GAM526) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7231] GAM526 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM526 was detected is described hereinabove with reference to Figs. 2-8.

[7232] GAM526 gene, herein designated GAM GENE, and GAM526 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7233] GAM526 gene, herein designated GAM GENE, encodes a GAM526 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM526 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM526 precursor RNA is designated SEQ ID:503, and is provided hereinbelow with reference to the sequence listing part.

[7234] GAM526 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM526 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7235] An enzyme complex designated DICER COMPLEX, dices the GAM526 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM526 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM526 RNA is designated SEQ ID:3103, and is provided hereinbelow with reference to the sequence listing part.

[7236] GAM526 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM526 target RNA, herein designated GAM TARGET RNA. GAM526 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7237] GAM526 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM526 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM526 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM526 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM526 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7238] The complementary binding of GAM526 RNA, herein designated GAM RNA, to target binding sites on GAM526 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM526 target RNA, herein designated GAM TARGET RNA, into GAM526 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7239] It is appreciated that GAM526 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM526 target genes. The mRNA of each one of this plurality of GAM526 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM526 RNA, herein designated GAM RNA, and which when bound by GAM526 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM526 target proteins.

[7240] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM526 gene, herein designated GAM GENE, on one or more GAM526 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7241] It is yet further appreciated that specific functions, and accordingly utilities, of GAM526 correlate with, and may be deduced from, the identity of the target genes which GAM526 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7242] Nucleotide sequences of the GAM526 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM526 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM526 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM526 are further described hereinbelow with reference to Table 1.

[7243] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM526 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7244] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 527 (GAM527) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7245] GAM527 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM527 was detected is described hereinabove with reference to Figs. 2-8.

[7246] GAM527 gene, herein designated GAM GENE, and GAM527 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7247] GAM527 gene, herein designated GAM GENE, encodes a GAM527 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM527 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM527 precursor RNA is designated SEQ ID:504, and is provided hereinbelow with reference to the sequence listing part.

[7248] GAM527 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM527 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7249] An enzyme complex designated DICER COMPLEX, dices the GAM527 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM527 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM527 RNA is designated SEQ ID:3104, and is provided hereinbelow with reference to the sequence listing part.

[7250] GAM527 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM527 target RNA, herein designated GAM TARGET RNA. GAM527 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7251] GAM527 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM527 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM527 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM527 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM527 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7252] The complementary binding of GAM527 RNA, herein designated GAM RNA, to target binding sites on GAM527 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM527 target RNA, herein designated GAM TARGET RNA, into GAM527 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7253] It is appreciated that GAM527 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM527 target genes. The mRNA of each one of this plurality of GAM527 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM527 RNA, herein designated GAM RNA, and which when bound by GAM527 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM527 target proteins.

[7254] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM527 gene, herein designated GAM GENE, on one or more

GAM527 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7255] It is yet further appreciated that specific functions, and accordingly utilities, of GAM527 correlate with, and may be deduced from, the identity of the target genes which GAM527 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7256] Nucleotide sequences of the GAM527 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM527 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM527 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM527 are further described hereinbelow with reference to Table 1.

[7257] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM527 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7258] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 528 (GAM528) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7259] GAM528 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM528 was detected is described hereinabove with reference to Figs. 2-8.

[7260] GAM528 gene, herein designated GAM GENE, and GAM528 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7261] GAM528 gene, herein designated GAM GENE, encodes a GAM528 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM528 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM528 precursor RNA is designated SEQ ID:505, and is provided hereinbelow with reference to the sequence listing part.

[7262] GAM528 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM528 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7263] An enzyme complex designated DICER COMPLEX, dices the GAM528 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM528 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM528 RNA is designated SEQ ID:3105, and is provided hereinbelow with reference to the sequence listing part.

[7264] GAM528 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM528 target RNA, herein designated GAM TARGET RNA. GAM528 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7265] GAM528 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM528 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM528 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM528 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM528 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7266] The complementary binding of GAM528 RNA, herein designated GAM RNA, to target binding sites on GAM528 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM528 target RNA, herein designated GAM TARGET RNA, into GAM528 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7267] It is appreciated that GAM528 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM528 target genes. The mRNA of each one of this plurality of GAM528 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM528 RNA, herein designated GAM RNA, and which when bound by GAM528 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM528 target proteins.

[7268] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM528 gene, herein designated GAM GENE, on one or more GAM528 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7269] It is yet further appreciated that specific functions, and accordingly utilities, of GAM528 correlate with, and may be deduced from, the identity of the target genes which GAM528 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7270] Nucleotide sequences of the GAM528 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM528 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM528 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM528 are further described hereinbelow with reference to Table 1.

[7271] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM528 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7272] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 529 (GAM529) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7273] GAM529 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM529 was detected is described hereinabove with reference to Figs. 2-8.

[7274] GAM529 gene, herein designated GAM GENE, and GAM529 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7275] GAM529 gene, herein designated GAM GENE, encodes a GAM529 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM529 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM529 precursor RNA is designated SEQ ID:506, and is provided hereinbelow with reference to the sequence listing part.

[7276] GAM529 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM529 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7277] An enzyme complex designated DICER COMPLEX, dices the GAM529 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM529 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM529 RNA is designated SEQ ID:3106, and is provided hereinbelow with reference to the sequence listing part.

[7278] GAM529 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM529 target RNA, herein designated GAM TARGET RNA. GAM529 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7279] GAM529 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM529

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM529 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM529 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM529 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7280] The complementary binding of GAM529 RNA, herein designated GAM RNA, to target binding sites on GAM529 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM529 target RNA, herein designated GAM TARGET RNA, into GAM529 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7281] It is appreciated that GAM529 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM529 target genes. The mRNA of each one of this plurality of GAM529 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM529 RNA, herein designated GAM RNA, and which when bound by GAM529 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM529 target proteins.

[7282] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM529 gene, herein designated GAM GENE, on one or more GAM529 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7283] It is yet further appreciated that specific functions, and accordingly utilities, of GAM529 correlate with, and may be deduced from, the identity of the target genes which GAM529 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7284] Nucleotide sequences of the GAM529 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM529 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM529 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM529 are further described hereinbelow with

reference to Table 1.

[7285] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM529 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7286] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 530 (GAM530) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7287] GAM530 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM530 was detected is described hereinabove with reference to Figs. 2-8.

[7288] GAM530 gene, herein designated GAM GENE, and GAM530 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7289] GAM530 gene, herein designated GAM GENE, encodes a GAM530 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM530 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM530 precursor RNA is designated SEQ ID:507, and is provided

hereinbelow with reference to the sequence listing part.

[7290] GAM530 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM530 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7291] An enzyme complex designated DICER COMPLEX, dices the GAM530 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM530 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM530 RNA is designated SEQ ID:3107, and is provided hereinbelow with reference to the sequence listing part.

[7292] GAM530 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM530 target RNA, herein designated GAM TARGET RNA. GAM530 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[7293] GAM530 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM530 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM530 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM530 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM530 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7294] The complementary binding of GAM530 RNA, herein designated GAM RNA, to target binding sites on GAM530 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM530 target RNA, herein designated GAM TARGET RNA, into GAM530 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7295] It is appreciated that GAM530 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM530 target genes. The mRNA of each one of this plurality of GAM530 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM530 RNA, herein designated GAM RNA, and which when bound by GAM530 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM530 target proteins.

[7296] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM530 gene, herein designated GAM GENE, on one or more GAM530 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7297] It is yet further appreciated that specific functions, and accordingly utilities, of GAM530 correlate with, and may be deduced from, the identity of the target genes which GAM530 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7298] Nucleotide sequences of the GAM530 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM530 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM530 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM530 are further described hereinbelow with reference to Table 1.

[7299] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM530 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7300] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 531 (GAM531) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7301] GAM531 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM531 was detected is described hereinabove with reference to Figs. 2-8.

[7302] GAM531 gene, herein designated GAM GENE, and GAM531 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7303] GAM531 gene, herein designated GAM GENE, encodes a GAM531 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM531 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM531 precursor RNA is designated SEQ ID:508, and is provided hereinbelow with reference to the sequence listing part.

[7304] GAM531 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM531 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7305] An enzyme complex designated DICER COMPLEX, dices the GAM531 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM531 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM531 RNA is designated SEQ ID:3108, and is provided hereinbelow with reference to the sequence listing part.

[7306] GAM531 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM531 target RNA, herein designated

GAM TARGET RNA. GAM531 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7307] GAM531 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM531 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM531 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM531 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM531 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7308] The complementary binding of GAM531 RNA, herein designated GAM RNA, to target binding sites on GAM531 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM531 target RNA, herein designated GAM

TARGET RNA, into GAM531 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7309] It is appreciated that GAM531 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM531 target genes. The mRNA of each one of this plurality of GAM531 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM531 RNA, herein designated GAM RNA, and which when bound by GAM531 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM531 target proteins.

[7310] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM531 gene, herein designated GAM GENE, on one or more GAM531 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7311] It is yet further appreciated that specific functions, and accordingly utilities, of GAM531 correlate with, and may be deduced from, the identity of the target

genes which GAM531 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7312] Nucleotide sequences of the GAM531 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM531 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM531 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM531 are further described hereinbelow with reference to Table 1.

[7313] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM531 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7314] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 532 (GAM532) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7315] GAM532 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM532 was detected is described hereinabove with reference to Figs. 2-8.

[7316] GAM532 gene, herein designated GAM GENE, and GAM532 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[7317] GAM532 gene, herein designated GAM GENE, encodes a GAM532 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM532 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM532 precursor RNA is designated SEQ ID:509, and is provided hereinbelow with reference to the sequence listing part.

[7318] GAM532 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM532 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7319] An enzyme complex designated DICER COMPLEX, dices the GAM532 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM532 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM532 RNA is designated SEQ ID:3110, and is provided

hereinbelow with reference to the sequence listing part.

[7320] GAM532 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM532 target RNA, herein designated GAM TARGET RNA. GAM532 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7321] GAM532 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM532 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM532 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM532 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM532 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7322] The complementary binding of GAM532 RNA, herein designated GAM RNA, to target binding sites on GAM532 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM532 target RNA, herein designated GAM TARGET RNA, into GAM532 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7323] It is appreciated that GAM532 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM532 target genes. The mRNA of each one of this plurality of GAM532 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM532 RNA, herein designated GAM RNA, and which when bound by GAM532 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM532 target proteins.

[7324] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM532 gene, herein designated GAM GENE, on one or more GAM532 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7325] It is yet further appreciated that specific functions, and accordingly utilities, of GAM532 correlate with, and may be deduced from, the identity of the target genes which GAM532 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7326] Nucleotide sequences of the GAM532 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM532 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM532 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM532 are further described hereinbelow with reference to Table 1.

[7327] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM532 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7328] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 533 (GAM533) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7329] GAM533 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM533 was detected is

described hereinabove with reference to Figs. 2-8.

[7330] GAM533 gene, herein designated GAM GENE, and GAM533 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7331] GAM533 gene, herein designated GAM GENE, encodes a GAM533 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM533 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM533 precursor RNA is designated SEQ ID:510, and is provided hereinbelow with reference to the sequence listing part.

[7332] GAM533 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM533 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7333] An enzyme complex designated DICER COMPLEX, dices the GAM533 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM533 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM533 RNA is designated SEQ ID:3109, and is provided hereinbelow with reference to the sequence listing part.

[7334] GAM533 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM533 target RNA, herein designated GAM TARGET RNA. GAM533 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7335] GAM533 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM533 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM533 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM533 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM533 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7336] The complementary binding of GAM533 RNA, herein designated GAM RNA, to target binding sites on GAM533 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM533 target RNA, herein designated GAM TARGET RNA, into GAM533 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7337] It is appreciated that GAM533 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM533 target genes. The mRNA of each one of this plurality of GAM533 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM533 RNA, herein designated GAM RNA, and which when bound by GAM533 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM533 target proteins.

[7338] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM533 gene, herein designated GAM GENE, on one or more GAM533 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7339] It is yet further appreciated that specific functions, and accordingly utilities, of GAM533 correlate with, and may be deduced from, the identity of the target genes which GAM533 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7340] Nucleotide sequences of the GAM533 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM533 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM533 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM533 are further described hereinbelow with reference to Table 1.

[7341] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM533 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7342] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 534 (GAM534) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7343] GAM534 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM534 was detected is described hereinabove with reference to Figs. 2-8.

[7344] GAM534 gene, herein designated GAM GENE, and GAM534 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7345] GAM534 gene, herein designated GAM GENE, encodes a GAM534 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM534 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM534 precursor RNA is designated SEQ ID:511, and is provided hereinbelow with reference to the sequence listing part.

[7346] GAM534 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM534 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7347] An enzyme complex designated DICER COMPLEX, dices the GAM534 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM534 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM534 RNA is designated SEQ ID:3111, and is provided hereinbelow with reference to the sequence listing part.

[7348] GAM534 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM534 target RNA, herein designated GAM TARGET RNA. GAM534 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7349] GAM534 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM534 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM534 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM534 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM534 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7350] The complementary binding of GAM534 RNA, herein designated GAM RNA, to target binding sites on GAM534 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM534 target RNA, herein designated GAM TARGET RNA, into GAM534 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7351] It is appreciated that GAM534 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM534 target genes. The mRNA of each one of this plurality of GAM534 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM534 RNA, herein designated GAM RNA, and which when bound by GAM534 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM534 target proteins.

[7352] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM534 gene, herein designated GAM GENE, on one or more GAM534 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7353] It is yet further appreciated that specific functions, and accordingly utilities, of GAM534 correlate with, and may be deduced from, the identity of the target genes which GAM534 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7354] Nucleotide sequences of the GAM534 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM534 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM534 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM534 are further described hereinbelow with reference to Table 1.

[7355] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM534 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7356] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 535 (GAM535) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7357] GAM535 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM535 was detected is described hereinabove with reference to Figs. 2-8.

[7358] GAM535 gene, herein designated GAM GENE, and GAM535 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7359] GAM535 gene, herein designated GAM GENE, encodes a GAM535 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM535 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM535 precursor RNA is designated SEQ ID:512, and is provided hereinbelow with reference to the sequence listing part.

[7360] GAM535 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM535 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7361] An enzyme complex designated DICER COMPLEX, dices the GAM535 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM535 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM535 RNA is designated SEQ ID:3112, and is provided hereinbelow with reference to the sequence listing part.

[7362] GAM535 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM535 target RNA, herein designated GAM TARGET RNA. GAM535 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7363] GAM535 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM535 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM535 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM535 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM535 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7364] The complementary binding of GAM535 RNA, herein designated GAM RNA, to target binding sites on GAM535 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM535 target RNA, herein designated GAM TARGET RNA, into GAM535 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7365] It is appreciated that GAM535 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM535 target genes. The mRNA of each one of this plurality of GAM535 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM535 RNA, herein designated GAM RNA, and which when bound by GAM535 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM535 target proteins.

[7366] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM535 gene, herein designated GAM GENE, on one or more

GAM535 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7367] It is yet further appreciated that specific functions, and accordingly utilities, of GAM535 correlate with, and may be deduced from, the identity of the target genes which GAM535 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7368] Nucleotide sequences of the GAM535 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM535 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM535 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM535 are further described hereinbelow with reference to Table 1.

[7369] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM535 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7370] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 536 (GAM536) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7371] GAM536 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM536 was detected is described hereinabove with reference to Figs. 2-8.

[7372] GAM536 gene, herein designated GAM GENE, and GAM536 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7373] GAM536 gene, herein designated GAM GENE, encodes a GAM536 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM536 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM536 precursor RNA is designated SEQ ID:513, and is provided hereinbelow with reference to the sequence listing part.

[7374] GAM536 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM536 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7375] An enzyme complex designated DICER COMPLEX, dices the GAM536 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM536 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM536 RNA is designated SEQ ID:3113, and is provided hereinbelow with reference to the sequence listing part.

[7376] GAM536 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM536 target RNA, herein designated GAM TARGET RNA. GAM536 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7377] GAM536 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM536 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM536 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM536 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM536 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7378] The complementary binding of GAM536 RNA, herein designated GAM RNA, to target binding sites on GAM536 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM536 target RNA, herein designated GAM TARGET RNA, into GAM536 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7379] It is appreciated that GAM536 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM536 target genes. The mRNA of each one of this plurality of GAM536 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM536 RNA, herein designated GAM RNA, and which when bound by GAM536 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM536 target proteins.

[7380] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM536 gene, herein designated GAM GENE, on one or more GAM536 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7381] It is yet further appreciated that specific functions, and accordingly utilities, of GAM536 correlate with, and may be deduced from, the identity of the target genes which GAM536 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7382] Nucleotide sequences of the GAM536 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM536 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM536 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM536 are further described hereinbelow with reference to Table 1.

[7383] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM536 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7384] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 537 (GAM537) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7385] GAM537 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM537 was detected is described hereinabove with reference to Figs. 2-8.

[7386] GAM537 gene, herein designated GAM GENE, and GAM537 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7387] GAM537 gene, herein designated GAM GENE, encodes a GAM537 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM537 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM537 precursor RNA is designated SEQ ID:514, and is provided hereinbelow with reference to the sequence listing part.

[7388] GAM537 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM537 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7389] An enzyme complex designated DICER COMPLEX, dices the GAM537 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM537 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM537 RNA is designated SEQ ID:3114, and is provided hereinbelow with reference to the sequence listing part.

[7390] GAM537 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM537 target RNA, herein designated GAM TARGET RNA. GAM537 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7391] GAM537 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM537

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM537 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM537 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM537 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7392] The complementary binding of GAM537 RNA, herein designated GAM RNA, to target binding sites on GAM537 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM537 target RNA, herein designated GAM TARGET RNA, into GAM537 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7393] It is appreciated that GAM537 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM537 target genes. The mRNA of each one of this plurality of GAM537 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM537 RNA, herein designated GAM RNA, and which when bound by GAM537 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM537 target proteins.

[7394] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM537 gene, herein designated GAM GENE, on one or more GAM537 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7395] It is yet further appreciated that specific functions, and accordingly utilities, of GAM537 correlate with, and may be deduced from, the identity of the target genes which GAM537 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7396] Nucleotide sequences of the GAM537 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM537 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM537 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM537 are further described hereinbelow with

reference to Table 1.

[7397] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM537 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7398] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 538 (GAM538) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7399] GAM538 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM538 was detected is described hereinabove with reference to Figs. 2-8.

[7400] GAM538 gene, herein designated GAM GENE, and GAM538 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7401] GAM538 gene, herein designated GAM GENE, encodes a GAM538 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM538 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM538 precursor RNA is designated SEQ ID:515, and is provided

hereinbelow with reference to the sequence listing part.

[7402] GAM538 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM538 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7403] An enzyme complex designated DICER COMPLEX, dices the GAM538 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM538 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM538 RNA is designated SEQ ID:3115, and is provided hereinbelow with reference to the sequence listing part.

[7404] GAM538 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM538 target RNA, herein designated GAM TARGET RNA. GAM538 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[7405] GAM538 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM538 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM538 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM538 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM538 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7406] The complementary binding of GAM538 RNA, herein designated GAM RNA, to target binding sites on GAM538 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM538 target RNA, herein designated GAM TARGET RNA, into GAM538 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7407] It is appreciated that GAM538 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM538 target genes. The mRNA of each one of this plurality of GAM538 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM538 RNA, herein designated GAM RNA, and which when bound by GAM538 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM538 target proteins.

[7408] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM538 gene, herein designated GAM GENE, on one or more GAM538 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7409] It is yet further appreciated that specific functions, and accordingly utilities, of GAM538 correlate with, and may be deduced from, the identity of the target genes which GAM538 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7410] Nucleotide sequences of the GAM538 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM538 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM538 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM538 are further described hereinbelow with reference to Table 1.

[7411] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM538 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7412] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 539 (GAM539) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7413] GAM539 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM539 was detected is described hereinabove with reference to Figs. 2-8.

[7414] GAM539 gene, herein designated GAM GENE, and GAM539 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7415] GAM539 gene, herein designated GAM GENE, encodes a GAM539 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM539 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM539 precursor RNA is designated SEQ ID:516, and is provided hereinbelow with reference to the sequence listing part.

[7416] GAM539 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM539 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7417] An enzyme complex designated DICER COMPLEX, dices the GAM539 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM539 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM539 RNA is designated SEQ ID:3116, and is provided hereinbelow with reference to the sequence listing part.

[7418] GAM539 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM539 target RNA, herein designated

GAM TARGET RNA. GAM539 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7419] GAM539 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM539 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM539 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM539 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM539 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7420] The complementary binding of GAM539 RNA, herein designated GAM RNA, to target binding sites on GAM539 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM539 target RNA, herein designated GAM

TARGET RNA, into GAM539 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7421] It is appreciated that GAM539 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM539 target genes. The mRNA of each one of this plurality of GAM539 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM539 RNA, herein designated GAM RNA, and which when bound by GAM539 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM539 target proteins.

[7422] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM539 gene, herein designated GAM GENE, on one or more GAM539 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7423] It is yet further appreciated that specific functions, and accordingly utilities, of GAM539 correlate with, and may be deduced from, the identity of the target

genes which GAM539 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7424] Nucleotide sequences of the GAM539 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM539 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM539 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM539 are further described hereinbelow with reference to Table 1.

[7425] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM539 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7426] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 540 (GAM540) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7427] GAM540 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM540 was detected is described hereinabove with reference to Figs. 2-8.

[7428] GAM540 gene, herein designated GAM GENE, and GAM540 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[7429] GAM540 gene, herein designated GAM GENE, encodes a GAM540 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM540 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM540 precursor RNA is designated SEQ ID:517, and is provided hereinbelow with reference to the sequence listing part.

[7430] GAM540 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM540 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7431] An enzyme complex designated DICER COMPLEX, dices the GAM540 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM540 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM540 RNA is designated SEQ ID:3117, and is provided

hereinbelow with reference to the sequence listing part.

[7432] GAM540 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM540 target RNA, herein designated GAM TARGET RNA. GAM540 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7433] GAM540 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM540 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM540 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM540 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM540 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7434] The complementary binding of GAM540 RNA, herein designated GAM RNA, to target binding sites on GAM540 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM540 target RNA, herein designated GAM TARGET RNA, into GAM540 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7435] It is appreciated that GAM540 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM540 target genes. The mRNA of each one of this plurality of GAM540 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM540 RNA, herein designated GAM RNA, and which when bound by GAM540 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM540 target proteins.

[7436] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM540 gene, herein designated GAM GENE, on one or more GAM540 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7437] It is yet further appreciated that specific functions, and accordingly utilities, of GAM540 correlate with, and may be deduced from, the identity of the target genes which GAM540 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7438] Nucleotide sequences of the GAM540 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM540 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM540 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM540 are further described hereinbelow with reference to Table 1.

[7439] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM540 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7440] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 541 (GAM541) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7441] GAM541 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM541 was detected is

described hereinabove with reference to Figs. 2-8.

[7442] GAM541 gene, herein designated GAM GENE, and GAM541 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7443] GAM541 gene, herein designated GAM GENE, encodes a GAM541 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM541 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM541 precursor RNA is designated SEQ ID:518, and is provided hereinbelow with reference to the sequence listing part.

[7444] GAM541 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM541 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7445] An enzyme complex designated DICER COMPLEX, dices the GAM541 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM541 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM541 RNA is designated SEQ ID:3119, and is provided hereinbelow with reference to the sequence listing part.

[7446] GAM541 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM541 target RNA, herein designated GAM TARGET RNA. GAM541 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7447] GAM541 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM541 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM541 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM541 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM541 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7448] The complementary binding of GAM541 RNA, herein designated GAM RNA, to target binding sites on GAM541 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM541 target RNA, herein designated GAM TARGET RNA, into GAM541 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7449] It is appreciated that GAM541 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM541 target genes. The mRNA of each one of this plurality of GAM541 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM541 RNA, herein designated GAM RNA, and which when bound by GAM541 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM541 target proteins.

[7450] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM541 gene, herein designated GAM GENE, on one or more GAM541 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7451] It is yet further appreciated that specific functions, and accordingly utilities, of GAM541 correlate with, and may be deduced from, the identity of the target genes which GAM541 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7452] Nucleotide sequences of the GAM541 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM541 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM541 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM541 are further described hereinbelow with reference to Table 1.

[7453] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM541 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7454] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 542 (GAM542) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7455] GAM542 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM542 was detected is described hereinabove with reference to Figs. 2-8.

[7456] GAM542 gene, herein designated GAM GENE, and GAM542 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7457] GAM542 gene, herein designated GAM GENE, encodes a GAM542 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM542 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM542 precursor RNA is designated SEQ ID:519, and is provided hereinbelow with reference to the sequence listing part.

[7458] GAM542 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM542 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7459] An enzyme complex designated DICER COMPLEX, dices the GAM542 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM542 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM542 RNA is designated SEQ ID:3118, and is provided hereinbelow with reference to the sequence listing part.

[7460] GAM542 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM542 target RNA, herein designated GAM TARGET RNA. GAM542 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7461] GAM542 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM542 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM542 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM542 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM542 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7462] The complementary binding of GAM542 RNA, herein designated GAM RNA, to target binding sites on GAM542 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM542 target RNA, herein designated GAM TARGET RNA, into GAM542 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7463] It is appreciated that GAM542 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM542 target genes. The mRNA of each one of this plurality of GAM542 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM542 RNA, herein designated GAM RNA, and which when bound by GAM542 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM542 target proteins.

[7464] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM542 gene, herein designated GAM GENE, on one or more GAM542 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7465] It is yet further appreciated that specific functions, and accordingly utilities, of GAM542 correlate with, and may be deduced from, the identity of the target genes which GAM542 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7466] Nucleotide sequences of the GAM542 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM542 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM542 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM542 are further described hereinbelow with reference to Table 1.

[7467] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM542 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7468] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 543 (GAM543) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7469] GAM543 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM543 was detected is described hereinabove with reference to Figs. 2-8.

[7470] GAM543 gene, herein designated GAM GENE, and GAM543 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7471] GAM543 gene, herein designated GAM GENE, encodes a GAM543 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM543 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM543 precursor RNA is designated SEQ ID:520, and is provided hereinbelow with reference to the sequence listing part.

[7472] GAM543 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM543 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7473] An enzyme complex designated DICER COMPLEX, dices the GAM543 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM543 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM543 RNA is designated SEQ ID:3120, and is provided hereinbelow with reference to the sequence listing part.

[7474] GAM543 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM543 target RNA, herein designated GAM TARGET RNA. GAM543 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7475] GAM543 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM543 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM543 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM543 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM543 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7476] The complementary binding of GAM543 RNA, herein designated GAM RNA, to target binding sites on GAM543 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM543 target RNA, herein designated GAM TARGET RNA, into GAM543 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7477] It is appreciated that GAM543 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM543 target genes. The mRNA of each one of this plurality of GAM543 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM543 RNA, herein designated GAM RNA, and which when bound by GAM543 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM543 target proteins.

[7478] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM543 gene, herein designated GAM GENE, on one or more

GAM543 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7479] It is yet further appreciated that specific functions, and accordingly utilities, of GAM543 correlate with, and may be deduced from, the identity of the target genes which GAM543 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7480] Nucleotide sequences of the GAM543 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM543 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM543 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM543 are further described hereinbelow with reference to Table 1.

[7481] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM543 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7482] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 544 (GAM544) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7483] GAM544 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM544 was detected is described hereinabove with reference to Figs. 2-8.

[7484] GAM544 gene, herein designated GAM GENE, and GAM544 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7485] GAM544 gene, herein designated GAM GENE, encodes a GAM544 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM544 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM544 precursor RNA is designated SEQ ID:521, and is provided hereinbelow with reference to the sequence listing part.

[7486] GAM544 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM544 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7487] An enzyme complex designated DICER COMPLEX, dices the GAM544 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM544 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM544 RNA is designated SEQ ID:3121, and is provided hereinbelow with reference to the sequence listing part.

[7488] GAM544 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM544 target RNA, herein designated GAM TARGET RNA. GAM544 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7489] GAM544 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM544 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM544 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM544 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM544 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7490] The complementary binding of GAM544 RNA, herein designated GAM RNA, to target binding sites on GAM544 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM544 target RNA, herein designated GAM TARGET RNA, into GAM544 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7491] It is appreciated that GAM544 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM544 target genes. The mRNA of each one of this plurality of GAM544 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM544 RNA, herein designated GAM RNA, and which when bound by GAM544 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM544 target proteins.

[7492] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM544 gene, herein designated GAM GENE, on one or more GAM544 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7493] It is yet further appreciated that specific functions, and accordingly utilities, of GAM544 correlate with, and may be deduced from, the identity of the target genes which GAM544 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7494] Nucleotide sequences of the GAM544 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM544 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM544 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM544 are further described hereinbelow with reference to Table 1.

[7495] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM544 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7496] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 545 (GAM545) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7497] GAM545 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM545 was detected is described hereinabove with reference to Figs. 2-8.

[7498] GAM545 gene, herein designated GAM GENE, and GAM545 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7499] GAM545 gene, herein designated GAM GENE, encodes a GAM545 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM545 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM545 precursor RNA is designated SEQ ID:522, and is provided hereinbelow with reference to the sequence listing part.

[7500] GAM545 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM545 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7501] An enzyme complex designated DICER COMPLEX, dices the GAM545 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM545 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM545 RNA is designated SEQ ID:3122, and is provided hereinbelow with reference to the sequence listing part.

[7502] GAM545 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM545 target RNA, herein designated GAM TARGET RNA. GAM545 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7503] GAM545 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM545

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM545 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM545 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM545 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7504] The complementary binding of GAM545 RNA, herein designated GAM RNA, to target binding sites on GAM545 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM545 target RNA, herein designated GAM TARGET RNA, into GAM545 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7505] It is appreciated that GAM545 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM545 target genes. The mRNA of each one of this plurality of GAM545 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM545 RNA, herein designated GAM RNA, and which when bound by GAM545 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM545 target proteins.

[7506] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM545 gene, herein designated GAM GENE, on one or more GAM545 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7507] It is yet further appreciated that specific functions, and accordingly utilities, of GAM545 correlate with, and may be deduced from, the identity of the target genes which GAM545 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7508] Nucleotide sequences of the GAM545 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM545 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM545 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM545 are further described hereinbelow with

reference to Table 1.

[7509] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM545 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7510] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 546 (GAM546) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7511] GAM546 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM546 was detected is described hereinabove with reference to Figs. 2-8.

[7512] GAM546 gene, herein designated GAM GENE, and GAM546 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7513] GAM546 gene, herein designated GAM GENE, encodes a GAM546 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM546 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM546 precursor RNA is designated SEQ ID:523, and is provided

hereinbelow with reference to the sequence listing part.

[7514] GAM546 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM546 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7515] An enzyme complex designated DICER COMPLEX, dices the GAM546 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM546 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM546 RNA is designated SEQ ID:3123, and is provided hereinbelow with reference to the sequence listing part.

[7516] GAM546 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM546 target RNA, herein designated GAM TARGET RNA. GAM546 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[7517] GAM546 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM546 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM546 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM546 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM546 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7518] The complementary binding of GAM546 RNA, herein designated GAM RNA, to target binding sites on GAM546 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM546 target RNA, herein designated GAM TARGET RNA, into GAM546 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7519] It is appreciated that GAM546 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM546 target genes. The mRNA of each one of this plurality of GAM546 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM546 RNA, herein designated GAM RNA, and which when bound by GAM546 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM546 target proteins.

[7520] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM546 gene, herein designated GAM GENE, on one or more GAM546 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7521] It is yet further appreciated that specific functions, and accordingly utilities, of GAM546 correlate with, and may be deduced from, the identity of the target genes which GAM546 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7522] Nucleotide sequences of the GAM546 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM546 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM546 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM546 are further described hereinbelow with reference to Table 1.

[7523] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM546 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7524] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 547 (GAM547) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7525] GAM547 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM547 was detected is described hereinabove with reference to Figs. 2-8.

[7526] GAM547 gene, herein designated GAM GENE, and GAM547 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7527] GAM547 gene, herein designated GAM GENE, encodes a GAM547 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM547 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM547 precursor RNA is designated SEQ ID:524, and is provided hereinbelow with reference to the sequence listing part.

[7528] GAM547 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM547 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7529] An enzyme complex designated DICER COMPLEX, dices the GAM547 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM547 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM547 RNA is designated SEQ ID:3124, and is provided hereinbelow with reference to the sequence listing part.

[7530] GAM547 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM547 target RNA, herein designated

GAM TARGET RNA. GAM547 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7531] GAM547 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM547 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM547 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM547 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM547 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7532] The complementary binding of GAM547 RNA, herein designated GAM RNA, to target binding sites on GAM547 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM547 target RNA, herein designated GAM

TARGET RNA, into GAM547 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7533] It is appreciated that GAM547 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM547 target genes. The mRNA of each one of this plurality of GAM547 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM547 RNA, herein designated GAM RNA, and which when bound by GAM547 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM547 target proteins.

[7534] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM547 gene, herein designated GAM GENE, on one or more GAM547 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7535] It is yet further appreciated that specific functions, and accordingly utilities, of GAM547 correlate with, and may be deduced from, the identity of the target

genes which GAM547 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7536] Nucleotide sequences of the GAM547 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM547 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM547 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM547 are further described hereinbelow with reference to Table 1.

[7537] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM547 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7538] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 548 (GAM548) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7539] GAM548 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM548 was detected is described hereinabove with reference to Figs. 2-8.

[7540] GAM548 gene, herein designated GAM GENE, and GAM548 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[7541] GAM548 gene, herein designated GAM GENE, encodes a GAM548 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM548 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM548 precursor RNA is designated SEQ ID:525, and is provided hereinbelow with reference to the sequence listing part.

[7542] GAM548 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM548 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7543] An enzyme complex designated DICER COMPLEX, dices the GAM548 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM548 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM548 RNA is designated SEQ ID:3125, and is provided

hereinbelow with reference to the sequence listing part.

[7544] GAM548 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM548 target RNA, herein designated GAM TARGET RNA. GAM548 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7545] GAM548 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM548 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM548 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM548 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM548 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7546] The complementary binding of GAM548 RNA, herein designated GAM RNA, to target binding sites on GAM548 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM548 target RNA, herein designated GAM TARGET RNA, into GAM548 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7547] It is appreciated that GAM548 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM548 target genes. The mRNA of each one of this plurality of GAM548 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM548 RNA, herein designated GAM RNA, and which when bound by GAM548 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM548 target proteins.

[7548] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM548 gene, herein designated GAM GENE, on one or more GAM548 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7549] It is yet further appreciated that specific functions, and accordingly utilities, of GAM548 correlate with, and may be deduced from, the identity of the target genes which GAM548 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7550] Nucleotide sequences of the GAM548 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM548 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM548 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM548 are further described hereinbelow with reference to Table 1.

[7551] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM548 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7552] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 549 (GAM549) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7553] GAM549 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM549 was detected is

described hereinabove with reference to Figs. 2-8.

[7554] GAM549 gene, herein designated GAM GENE, and GAM549 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7555] GAM549 gene, herein designated GAM GENE, encodes a GAM549 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM549 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM549 precursor RNA is designated SEQ ID:526, and is provided hereinbelow with reference to the sequence listing part.

[7556] GAM549 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM549 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7557] An enzyme complex designated DICER COMPLEX, dices the GAM549 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM549 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM549 RNA is designated SEQ ID:3126, and is provided hereinbelow with reference to the sequence listing part.

[7558] GAM549 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM549 target RNA, herein designated GAM TARGET RNA. GAM549 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7559] GAM549 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM549 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM549 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM549 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM549 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7560] The complementary binding of GAM549 RNA, herein designated GAM RNA, to target binding sites on GAM549 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM549 target RNA, herein designated GAM TARGET RNA, into GAM549 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7561] It is appreciated that GAM549 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM549 target genes. The mRNA of each one of this plurality of GAM549 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM549 RNA, herein designated GAM RNA, and which when bound by GAM549 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM549 target proteins.

[7562] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM549 gene, herein designated GAM GENE, on one or more GAM549 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7563] It is yet further appreciated that specific functions, and accordingly utilities, of GAM549 correlate with, and may be deduced from, the identity of the target genes which GAM549 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7564] Nucleotide sequences of the GAM549 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM549 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM549 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM549 are further described hereinbelow with reference to Table 1.

[7565] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM549 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7566] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 550 (GAM550) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7567] GAM550 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM550 was detected is described hereinabove with reference to Figs. 2-8.

[7568] GAM550 gene, herein designated GAM GENE, and GAM550 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7569] GAM550 gene, herein designated GAM GENE, encodes a GAM550 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM550 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM550 precursor RNA is designated SEQ ID:527, and is provided hereinbelow with reference to the sequence listing part.

[7570] GAM550 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM550 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7571] An enzyme complex designated DICER COMPLEX, dices the GAM550 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM550 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM550 RNA is designated SEQ ID:3127, and is provided hereinbelow with reference to the sequence listing part.

[7572] GAM550 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM550 target RNA, herein designated GAM TARGET RNA. GAM550 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7573] GAM550 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM550 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM550 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM550 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM550 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7574] The complementary binding of GAM550 RNA, herein designated GAM RNA, to target binding sites on GAM550 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM550 target RNA, herein designated GAM TARGET RNA, into GAM550 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7575] It is appreciated that GAM550 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM550 target genes. The mRNA of each one of this plurality of GAM550 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM550 RNA, herein designated GAM RNA, and which when bound by GAM550 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM550 target proteins.

[7576] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM550 gene, herein designated GAM GENE, on one or more GAM550 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7577] It is yet further appreciated that specific functions, and accordingly utilities, of GAM550 correlate with, and may be deduced from, the identity of the target genes which GAM550 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7578] Nucleotide sequences of the GAM550 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM550 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM550 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM550 are further described hereinbelow with reference to Table 1.

[7579] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM550 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7580] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 551 (GAM551) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7581] GAM551 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM551 was detected is described hereinabove with reference to Figs. 2-8.

[7582] GAM551 gene, herein designated GAM GENE, and GAM551 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7583] GAM551 gene, herein designated GAM GENE, encodes a GAM551 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM551 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM551 precursor RNA is designated SEQ ID:528, and is provided hereinbelow with reference to the sequence listing part.

[7584] GAM551 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM551 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7585] An enzyme complex designated DICER COMPLEX, dices the GAM551 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM551 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM551 RNA is designated SEQ ID:3128, and is provided hereinbelow with reference to the sequence listing part.

[7586] GAM551 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM551 target RNA, herein designated GAM TARGET RNA. GAM551 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7587] GAM551 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM551 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM551 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM551 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM551 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7588] The complementary binding of GAM551 RNA, herein designated GAM RNA, to target binding sites on GAM551 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM551 target RNA, herein designated GAM TARGET RNA, into GAM551 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7589] It is appreciated that GAM551 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM551 target genes. The mRNA of each one of this plurality of GAM551 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM551 RNA, herein designated GAM RNA, and which when bound by GAM551 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM551 target proteins.

[7590] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM551 gene, herein designated GAM GENE, on one or more

GAM551 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7591] It is yet further appreciated that specific functions, and accordingly utilities, of GAM551 correlate with, and may be deduced from, the identity of the target genes which GAM551 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7592] Nucleotide sequences of the GAM551 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM551 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM551 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM551 are further described hereinbelow with reference to Table 1.

[7593] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM551 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7594] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 552 (GAM552) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7595] GAM552 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM552 was detected is described hereinabove with reference to Figs. 2-8.

[7596] GAM552 gene, herein designated GAM GENE, and GAM552 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7597] GAM552 gene, herein designated GAM GENE, encodes a GAM552 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM552 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM552 precursor RNA is designated SEQ ID:529, and is provided hereinbelow with reference to the sequence listing part.

[7598] GAM552 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM552 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7599] An enzyme complex designated DICER COMPLEX, dices the GAM552 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM552 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM552 RNA is designated SEQ ID:3129, and is provided hereinbelow with reference to the sequence listing part.

[7600] GAM552 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM552 target RNA, herein designated GAM TARGET RNA. GAM552 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7601] GAM552 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM552 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM552 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM552 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM552 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7602] The complementary binding of GAM552 RNA, herein designated GAM RNA, to target binding sites on GAM552 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM552 target RNA, herein designated GAM TARGET RNA, into GAM552 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7603] It is appreciated that GAM552 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM552 target genes. The mRNA of each one of this plurality of GAM552 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM552 RNA, herein designated GAM RNA, and which when bound by GAM552 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM552 target proteins.

[7604] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM552 gene, herein designated GAM GENE, on one or more GAM552 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7605] It is yet further appreciated that specific functions, and accordingly utilities, of GAM552 correlate with, and may be deduced from, the identity of the target genes which GAM552 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7606] Nucleotide sequences of the GAM552 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM552 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM552 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM552 are further described hereinbelow with reference to Table 1.

[7607] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM552 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7608] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 553 (GAM553) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7609] GAM553 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM553 was detected is described hereinabove with reference to Figs. 2-8.

[7610] GAM553 gene, herein designated GAM GENE, and GAM553 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7611] GAM553 gene, herein designated GAM GENE, encodes a GAM553 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM553 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM553 precursor RNA is designated SEQ ID:530, and is provided hereinbelow with reference to the sequence listing part.

[7612] GAM553 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM553 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7613] An enzyme complex designated DICER COMPLEX, dices the GAM553 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM553 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM553 RNA is designated SEQ ID:3131, and is provided hereinbelow with reference to the sequence listing part.

[7614] GAM553 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM553 target RNA, herein designated GAM TARGET RNA. GAM553 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7615] GAM553 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM553

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM553 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM553 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM553 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7616] The complementary binding of GAM553 RNA, herein designated GAM RNA, to target binding sites on GAM553 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM553 target RNA, herein designated GAM TARGET RNA, into GAM553 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7617] It is appreciated that GAM553 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM553 target genes. The mRNA of each one of this plurality of GAM553 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM553 RNA, herein designated GAM RNA, and which when bound by GAM553 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM553 target proteins.

[7618] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM553 gene, herein designated GAM GENE, on one or more GAM553 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7619] It is yet further appreciated that specific functions, and accordingly utilities, of GAM553 correlate with, and may be deduced from, the identity of the target genes which GAM553 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7620] Nucleotide sequences of the GAM553 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM553 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM553 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM553 are further described hereinbelow with

reference to Table 1.

[7621] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM553 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7622] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 554 (GAM554) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7623] GAM554 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM554 was detected is described hereinabove with reference to Figs. 2-8.

[7624] GAM554 gene, herein designated GAM GENE, and GAM554 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7625] GAM554 gene, herein designated GAM GENE, encodes a GAM554 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM554 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM554 precursor RNA is designated SEQ ID:531, and is provided

hereinbelow with reference to the sequence listing part.

[7626] GAM554 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM554 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7627] An enzyme complex designated DICER COMPLEX, dices the GAM554 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM554 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM554 RNA is designated SEQ ID:3130, and is provided hereinbelow with reference to the sequence listing part.

[7628] GAM554 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM554 target RNA, herein designated GAM TARGET RNA. GAM554 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[7629] GAM554 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM554 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM554 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM554 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM554 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7630] The complementary binding of GAM554 RNA, herein designated GAM RNA, to target binding sites on GAM554 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM554 target RNA, herein designated GAM TARGET RNA, into GAM554 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7631] It is appreciated that GAM554 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM554 target genes. The mRNA of each one of this plurality of GAM554 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM554 RNA, herein designated GAM RNA, and which when bound by GAM554 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM554 target proteins.

[7632] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM554 gene, herein designated GAM GENE, on one or more GAM554 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7633] It is yet further appreciated that specific functions, and accordingly utilities, of GAM554 correlate with, and may be deduced from, the identity of the target genes which GAM554 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7634] Nucleotide sequences of the GAM554 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM554 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM554 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM554 are further described hereinbelow with reference to Table 1.

[7635] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM554 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7636] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 555 (GAM555) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7637] GAM555 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM555 was detected is described hereinabove with reference to Figs. 2-8.

[7638] GAM555 gene, herein designated GAM GENE, and GAM555 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7639] GAM555 gene, herein designated GAM GENE, encodes a GAM555 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM555 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM555 precursor RNA is designated SEQ ID:532, and is provided hereinbelow with reference to the sequence listing part.

[7640] GAM555 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM555 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7641] An enzyme complex designated DICER COMPLEX, dices the GAM555 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM555 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM555 RNA is designated SEQ ID:3132, and is provided hereinbelow with reference to the sequence listing part.

[7642] GAM555 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM555 target RNA, herein designated

GAM TARGET RNA. GAM555 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7643] GAM555 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM555 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM555 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM555 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM555 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7644] The complementary binding of GAM555 RNA, herein designated GAM RNA, to target binding sites on GAM555 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM555 target RNA, herein designated GAM

TARGET RNA, into GAM555 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7645] It is appreciated that GAM555 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM555 target genes. The mRNA of each one of this plurality of GAM555 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM555 RNA, herein designated GAM RNA, and which when bound by GAM555 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM555 target proteins.

[7646] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM555 gene, herein designated GAM GENE, on one or more GAM555 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7647] It is yet further appreciated that specific functions, and accordingly utilities, of GAM555 correlate with, and may be deduced from, the identity of the target

genes which GAM555 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7648] Nucleotide sequences of the GAM555 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM555 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM555 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM555 are further described hereinbelow with reference to Table 1.

[7649] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM555 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7650] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 556 (GAM556) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7651] GAM556 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM556 was detected is described hereinabove with reference to Figs. 2-8.

[7652] GAM556 gene, herein designated GAM GENE, and GAM556 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[7653] GAM556 gene, herein designated GAM GENE, encodes a GAM556 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM556 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM556 precursor RNA is designated SEQ ID:533, and is provided hereinbelow with reference to the sequence listing part.

[7654] GAM556 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM556 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7655] An enzyme complex designated DICER COMPLEX, dices the GAM556 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM556 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM556 RNA is designated SEQ ID:3133, and is provided

hereinbelow with reference to the sequence listing part.

[7656] GAM556 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM556 target RNA, herein designated GAM TARGET RNA. GAM556 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7657] GAM556 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM556 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM556 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM556 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM556 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7658] The complementary binding of GAM556 RNA, herein designated GAM RNA, to target binding sites on GAM556 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM556 target RNA, herein designated GAM TARGET RNA, into GAM556 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7659] It is appreciated that GAM556 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM556 target genes. The mRNA of each one of this plurality of GAM556 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM556 RNA, herein designated GAM RNA, and which when bound by GAM556 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM556 target proteins.

[7660] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM556 gene, herein designated GAM GENE, on one or more GAM556 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7661] It is yet further appreciated that specific functions, and accordingly utilities, of GAM556 correlate with, and may be deduced from, the identity of the target genes which GAM556 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7662] Nucleotide sequences of the GAM556 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM556 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM556 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM556 are further described hereinbelow with reference to Table 1.

[7663] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM556 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7664] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 557 (GAM557) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7665] GAM557 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM557 was detected is

described hereinabove with reference to Figs. 2-8.

[7666] GAM557 gene, herein designated GAM GENE, and GAM557 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7667] GAM557 gene, herein designated GAM GENE, encodes a GAM557 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM557 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM557 precursor RNA is designated SEQ ID:534, and is provided hereinbelow with reference to the sequence listing part.

[7668] GAM557 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM557 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7669] An enzyme complex designated DICER COMPLEX, dices the GAM557 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM557 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM557 RNA is designated SEQ ID:3135, and is provided hereinbelow with reference to the sequence listing part.

[7670] GAM557 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM557 target RNA, herein designated GAM TARGET RNA. GAM557 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7671] GAM557 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM557 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM557 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM557 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM557 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7672] The complementary binding of GAM557 RNA, herein designated GAM RNA, to target binding sites on GAM557 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM557 target RNA, herein designated GAM TARGET RNA, into GAM557 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7673] It is appreciated that GAM557 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM557 target genes. The mRNA of each one of this plurality of GAM557 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM557 RNA, herein designated GAM RNA, and which when bound by GAM557 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM557 target proteins.

[7674] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM557 gene, herein designated GAM GENE, on one or more GAM557 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7675] It is yet further appreciated that specific functions, and accordingly utilities, of GAM557 correlate with, and may be deduced from, the identity of the target genes which GAM557 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7676] Nucleotide sequences of the GAM557 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM557 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM557 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM557 are further described hereinbelow with reference to Table 1.

[7677] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM557 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7678] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 558 (GAM558) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7679] GAM558 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM558 was detected is described hereinabove with reference to Figs. 2-8.

[7680] GAM558 gene, herein designated GAM GENE, and GAM558 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7681] GAM558 gene, herein designated GAM GENE, encodes a GAM558 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM558 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM558 precursor RNA is designated SEQ ID:535, and is provided hereinbelow with reference to the sequence listing part.

[7682] GAM558 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM558 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7683] An enzyme complex designated DICER COMPLEX, dices the GAM558 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM558 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM558 RNA is designated SEQ ID:3134, and is provided hereinbelow with reference to the sequence listing part.

[7684] GAM558 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM558 target RNA, herein designated GAM TARGET RNA. GAM558 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7685] GAM558 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM558 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM558 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM558 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM558 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7686] The complementary binding of GAM558 RNA, herein designated GAM RNA, to target binding sites on GAM558 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM558 target RNA, herein designated GAM TARGET RNA, into GAM558 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7687] It is appreciated that GAM558 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM558 target genes. The mRNA of each one of this plurality of GAM558 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM558 RNA, herein designated GAM RNA, and which when bound by GAM558 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM558 target proteins.

[7688] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM558 gene, herein designated GAM GENE, on one or more GAM558 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7689] It is yet further appreciated that specific functions, and accordingly utilities, of GAM558 correlate with, and may be deduced from, the identity of the target genes which GAM558 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7690] Nucleotide sequences of the GAM558 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM558 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM558 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM558 are further described hereinbelow with reference to Table 1.

[7691] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM558 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7692] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 559 (GAM559) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7693] GAM559 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM559 was detected is described hereinabove with reference to Figs. 2-8.

[7694] GAM559 gene, herein designated GAM GENE, and GAM559 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7695] GAM559 gene, herein designated GAM GENE, encodes a GAM559 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM559 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM559 precursor RNA is designated SEQ ID:536, and is provided hereinbelow with reference to the sequence listing part.

[7696] GAM559 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM559 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7697] An enzyme complex designated DICER COMPLEX, dices the GAM559 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM559 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM559 RNA is designated SEQ ID:3136, and is provided hereinbelow with reference to the sequence listing part.

[7698] GAM559 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM559 target RNA, herein designated GAM TARGET RNA. GAM559 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7699] GAM559 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM559 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM559 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM559 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM559 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7700] The complementary binding of GAM559 RNA, herein designated GAM RNA, to target binding sites on GAM559 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM559 target RNA, herein designated GAM TARGET RNA, into GAM559 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7701] It is appreciated that GAM559 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM559 target genes. The mRNA of each one of this plurality of GAM559 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM559 RNA, herein designated GAM RNA, and which when bound by GAM559 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM559 target proteins.

[7702] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM559 gene, herein designated GAM GENE, on one or more

GAM559 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7703] It is yet further appreciated that specific functions, and accordingly utilities, of GAM559 correlate with, and may be deduced from, the identity of the target genes which GAM559 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7704] Nucleotide sequences of the GAM559 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM559 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM559 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM559 are further described hereinbelow with reference to Table 1.

[7705] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM559 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7706] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 560 (GAM560) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7707] GAM560 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM560 was detected is described hereinabove with reference to Figs. 2-8.

[7708] GAM560 gene, herein designated GAM GENE, and GAM560 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7709] GAM560 gene, herein designated GAM GENE, encodes a GAM560 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM560 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM560 precursor RNA is designated SEQ ID:537, and is provided hereinbelow with reference to the sequence listing part.

[7710] GAM560 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM560 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7711] An enzyme complex designated DICER COMPLEX, dices the GAM560 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM560 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM560 RNA is designated SEQ ID:3137, and is provided hereinbelow with reference to the sequence listing part.

[7712] GAM560 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM560 target RNA, herein designated GAM TARGET RNA. GAM560 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7713] GAM560 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM560 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM560 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM560 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM560 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7714] The complementary binding of GAM560 RNA, herein designated GAM RNA, to target binding sites on GAM560 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM560 target RNA, herein designated GAM TARGET RNA, into GAM560 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7715] It is appreciated that GAM560 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM560 target genes. The mRNA of each one of this plurality of GAM560 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM560 RNA, herein designated GAM RNA, and which when bound by GAM560 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM560 target proteins.

[7716] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM560 gene, herein designated GAM GENE, on one or more GAM560 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7717] It is yet further appreciated that specific functions, and accordingly utilities, of GAM560 correlate with, and may be deduced from, the identity of the target genes which GAM560 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7718] Nucleotide sequences of the GAM560 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM560 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM560 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM560 are further described hereinbelow with reference to Table 1.

[7719] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM560 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7720] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 561 (GAM561) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7721] GAM561 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM561 was detected is described hereinabove with reference to Figs. 2-8.

[7722] GAM561 gene, herein designated GAM GENE, and GAM561 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7723] GAM561 gene, herein designated GAM GENE, encodes a GAM561 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM561 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM561 precursor RNA is designated SEQ ID:538, and is provided hereinbelow with reference to the sequence listing part.

[7724] GAM561 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM561 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7725] An enzyme complex designated DICER COMPLEX, dices the GAM561 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM561 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM561 RNA is designated SEQ ID:3139, and is provided hereinbelow with reference to the sequence listing part.

[7726] GAM561 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM561 target RNA, herein designated GAM TARGET RNA. GAM561 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7727] GAM561 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM561

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM561 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM561 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM561 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7728] The complementary binding of GAM561 RNA, herein designated GAM RNA, to target binding sites on GAM561 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM561 target RNA, herein designated GAM TARGET RNA, into GAM561 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7729] It is appreciated that GAM561 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM561 target genes. The mRNA of each one of this plurality of GAM561 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM561 RNA, herein designated GAM RNA, and which when bound by GAM561 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM561 target proteins.

[7730] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM561 gene, herein designated GAM GENE, on one or more GAM561 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7731] It is yet further appreciated that specific functions, and accordingly utilities, of GAM561 correlate with, and may be deduced from, the identity of the target genes which GAM561 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7732] Nucleotide sequences of the GAM561 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM561 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM561 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM561 are further described hereinbelow with

reference to Table 1.

[7733] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM561 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7734] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 562 (GAM562) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7735] GAM562 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM562 was detected is described hereinabove with reference to Figs. 2-8.

[7736] GAM562 gene, herein designated GAM GENE, and GAM562 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7737] GAM562 gene, herein designated GAM GENE, encodes a GAM562 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM562 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM562 precursor RNA is designated SEQ ID:539, and is provided

hereinbelow with reference to the sequence listing part.

[7738] GAM562 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM562 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7739] An enzyme complex designated DICER COMPLEX, dices the GAM562 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM562 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM562 RNA is designated SEQ ID:3138, and is provided hereinbelow with reference to the sequence listing part.

[7740] GAM562 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM562 target RNA, herein designated GAM TARGET RNA. GAM562 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[7741] GAM562 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM562 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM562 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM562 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM562 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7742] The complementary binding of GAM562 RNA, herein designated GAM RNA, to target binding sites on GAM562 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM562 target RNA, herein designated GAM TARGET RNA, into GAM562 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7743] It is appreciated that GAM562 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM562 target genes. The mRNA of each one of this plurality of GAM562 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM562 RNA, herein designated GAM RNA, and which when bound by GAM562 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM562 target proteins.

[7744] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM562 gene, herein designated GAM GENE, on one or more GAM562 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7745] It is yet further appreciated that specific functions, and accordingly utilities, of GAM562 correlate with, and may be deduced from, the identity of the target genes which GAM562 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7746] Nucleotide sequences of the GAM562 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM562 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM562 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM562 are further described hereinbelow with reference to Table 1.

[7747] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM562 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7748] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 563 (GAM563) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7749] GAM563 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM563 was detected is described hereinabove with reference to Figs. 2-8.

[7750] GAM563 gene, herein designated GAM GENE, and GAM563 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7751] GAM563 gene, herein designated GAM GENE, encodes a GAM563 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM563 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM563 precursor RNA is designated SEQ ID:540, and is provided hereinbelow with reference to the sequence listing part.

[7752] GAM563 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM563 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7753] An enzyme complex designated DICER COMPLEX, dices the GAM563 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM563 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM563 RNA is designated SEQ ID:3140, and is provided hereinbelow with reference to the sequence listing part.

[7754] GAM563 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM563 target RNA, herein designated

GAM TARGET RNA. GAM563 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7755] GAM563 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM563 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM563 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM563 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM563 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7756] The complementary binding of GAM563 RNA, herein designated GAM RNA, to target binding sites on GAM563 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM563 target RNA, herein designated GAM

TARGET RNA, into GAM563 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7757] It is appreciated that GAM563 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM563 target genes. The mRNA of each one of this plurality of GAM563 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM563 RNA, herein designated GAM RNA, and which when bound by GAM563 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM563 target proteins.

[7758] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM563 gene, herein designated GAM GENE, on one or more GAM563 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7759] It is yet further appreciated that specific functions, and accordingly utilities, of GAM563 correlate with, and may be deduced from, the identity of the target

genes which GAM563 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7760] Nucleotide sequences of the GAM563 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM563 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM563 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM563 are further described hereinbelow with reference to Table 1.

[7761] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM563 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7762] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 564 (GAM564) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7763] GAM564 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM564 was detected is described hereinabove with reference to Figs. 2-8.

[7764] GAM564 gene, herein designated GAM GENE, and GAM564 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[7765] GAM564 gene, herein designated GAM GENE, encodes a GAM564 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM564 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM564 precursor RNA is designated SEQ ID:541, and is provided hereinbelow with reference to the sequence listing part.

[7766] GAM564 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM564 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7767] An enzyme complex designated DICER COMPLEX, dices the GAM564 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM564 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM564 RNA is designated SEQ ID:3141, and is provided

hereinbelow with reference to the sequence listing part.

[7768] GAM564 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM564 target RNA, herein designated GAM TARGET RNA. GAM564 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7769] GAM564 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM564 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM564 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM564 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM564 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7770] The complementary binding of GAM564 RNA, herein designated GAM RNA, to target binding sites on GAM564 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM564 target RNA, herein designated GAM TARGET RNA, into GAM564 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7771] It is appreciated that GAM564 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM564 target genes. The mRNA of each one of this plurality of GAM564 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM564 RNA, herein designated GAM RNA, and which when bound by GAM564 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM564 target proteins.

[7772] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM564 gene, herein designated GAM GENE, on one or more GAM564 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7773] It is yet further appreciated that specific functions, and accordingly utilities, of GAM564 correlate with, and may be deduced from, the identity of the target genes which GAM564 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7774] Nucleotide sequences of the GAM564 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM564 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM564 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM564 are further described hereinbelow with reference to Table 1.

[7775] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM564 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7776] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 565 (GAM565) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7777] GAM565 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM565 was detected is

described hereinabove with reference to Figs. 2-8.

[7778] GAM565 gene, herein designated GAM GENE, and GAM565 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7779] GAM565 gene, herein designated GAM GENE, encodes a GAM565 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM565 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM565 precursor RNA is designated SEQ ID:542, and is provided hereinbelow with reference to the sequence listing part.

[7780] GAM565 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM565 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7781] An enzyme complex designated DICER COMPLEX, dices the GAM565 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM565 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM565 RNA is designated SEQ ID:3144, and is provided hereinbelow with reference to the sequence listing part.

[7782] GAM565 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM565 target RNA, herein designated GAM TARGET RNA. GAM565 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7783] GAM565 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM565 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM565 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM565 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM565 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7784] The complementary binding of GAM565 RNA, herein designated GAM RNA, to target binding sites on GAM565 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM565 target RNA, herein designated GAM TARGET RNA, into GAM565 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7785] It is appreciated that GAM565 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM565 target genes. The mRNA of each one of this plurality of GAM565 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM565 RNA, herein designated GAM RNA, and which when bound by GAM565 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM565 target proteins.

[7786] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM565 gene, herein designated GAM GENE, on one or more GAM565 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7787] It is yet further appreciated that specific functions, and accordingly utilities, of GAM565 correlate with, and may be deduced from, the identity of the target genes which GAM565 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7788] Nucleotide sequences of the GAM565 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM565 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM565 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM565 are further described hereinbelow with reference to Table 1.

[7789] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM565 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7790] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 566 (GAM566) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7791] GAM566 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM566 was detected is described hereinabove with reference to Figs. 2-8.

[7792] GAM566 gene, herein designated GAM GENE, and GAM566 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7793] GAM566 gene, herein designated GAM GENE, encodes a GAM566 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM566 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM566 precursor RNA is designated SEQ ID:543, and is provided hereinbelow with reference to the sequence listing part.

[7794] GAM566 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM566 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7795] An enzyme complex designated DICER COMPLEX, dices the GAM566 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM566 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM566 RNA is designated SEQ ID:3142, and is provided hereinbelow with reference to the sequence listing part.

[7796] GAM566 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM566 target RNA, herein designated GAM TARGET RNA. GAM566 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7797] GAM566 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM566 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM566 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM566 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM566 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7798] The complementary binding of GAM566 RNA, herein designated GAM RNA, to target binding sites on GAM566 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM566 target RNA, herein designated GAM TARGET RNA, into GAM566 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7799] It is appreciated that GAM566 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM566 target genes. The mRNA of each one of this plurality of GAM566 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM566 RNA, herein designated GAM RNA, and which when bound by GAM566 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM566 target proteins.

[7800] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM566 gene, herein designated GAM GENE, on one or more GAM566 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7801] It is yet further appreciated that specific functions, and accordingly utilities, of GAM566 correlate with, and may be deduced from, the identity of the target genes which GAM566 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7802] Nucleotide sequences of the GAM566 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM566 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM566 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM566 are further described hereinbelow with reference to Table 1.

[7803] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM566 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7804] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 567 (GAM567) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7805] GAM567 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM567 was detected is described hereinabove with reference to Figs. 2-8.

[7806] GAM567 gene, herein designated GAM GENE, and GAM567 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7807] GAM567 gene, herein designated GAM GENE, encodes a GAM567 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM567 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM567 precursor RNA is designated SEQ ID:544, and is provided hereinbelow with reference to the sequence listing part.

[7808] GAM567 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM567 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7809] An enzyme complex designated DICER COMPLEX, dices the GAM567 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM567 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM567 RNA is designated SEQ ID:3143, and is provided hereinbelow with reference to the sequence listing part.

[7810] GAM567 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM567 target RNA, herein designated GAM TARGET RNA. GAM567 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7811] GAM567 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM567 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM567 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM567 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM567 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7812] The complementary binding of GAM567 RNA, herein designated GAM RNA, to target binding sites on GAM567 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM567 target RNA, herein designated GAM TARGET RNA, into GAM567 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7813] It is appreciated that GAM567 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM567 target genes. The mRNA of each one of this plurality of GAM567 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM567 RNA, herein designated GAM RNA, and which when bound by GAM567 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM567 target proteins.

[7814] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM567 gene, herein designated GAM GENE, on one or more

GAM567 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7815] It is yet further appreciated that specific functions, and accordingly utilities, of GAM567 correlate with, and may be deduced from, the identity of the target genes which GAM567 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7816] Nucleotide sequences of the GAM567 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM567 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM567 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM567 are further described hereinbelow with reference to Table 1.

[7817] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM567 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7818] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 568 (GAM568) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7819] GAM568 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM568 was detected is described hereinabove with reference to Figs. 2-8.

[7820] GAM568 gene, herein designated GAM GENE, and GAM568 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7821] GAM568 gene, herein designated GAM GENE, encodes a GAM568 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM568 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM568 precursor RNA is designated SEQ ID:545, and is provided hereinbelow with reference to the sequence listing part.

[7822] GAM568 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM568 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7823] An enzyme complex designated DICER COMPLEX, dices the GAM568 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM568 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM568 RNA is designated SEQ ID:3145, and is provided hereinbelow with reference to the sequence listing part.

[7824] GAM568 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM568 target RNA, herein designated GAM TARGET RNA. GAM568 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7825] GAM568 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM568 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM568 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM568 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM568 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7826] The complementary binding of GAM568 RNA, herein designated GAM RNA, to target binding sites on GAM568 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM568 target RNA, herein designated GAM TARGET RNA, into GAM568 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7827] It is appreciated that GAM568 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM568 target genes. The mRNA of each one of this plurality of GAM568 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM568 RNA, herein designated GAM RNA, and which when bound by GAM568 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM568 target proteins.

[7828] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM568 gene, herein designated GAM GENE, on one or more GAM568 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7829] It is yet further appreciated that specific functions, and accordingly utilities, of GAM568 correlate with, and may be deduced from, the identity of the target genes which GAM568 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7830] Nucleotide sequences of the GAM568 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM568 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM568 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM568 are further described hereinbelow with reference to Table 1.

[7831] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM568 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7832] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 569 (GAM569) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7833] GAM569 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM569 was detected is described hereinabove with reference to Figs. 2-8.

[7834] GAM569 gene, herein designated GAM GENE, and GAM569 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7835] GAM569 gene, herein designated GAM GENE, encodes a GAM569 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM569 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM569 precursor RNA is designated SEQ ID:546, and is provided hereinbelow with reference to the sequence listing part.

[7836] GAM569 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM569 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7837] An enzyme complex designated DICER COMPLEX, dices the GAM569 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM569 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM569 RNA is designated SEQ ID:3146, and is provided hereinbelow with reference to the sequence listing part.

[7838] GAM569 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM569 target RNA, herein designated GAM TARGET RNA. GAM569 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7839] GAM569 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM569

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM569 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM569 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM569 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7840] The complementary binding of GAM569 RNA, herein designated GAM RNA, to target binding sites on GAM569 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM569 target RNA, herein designated GAM TARGET RNA, into GAM569 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7841] It is appreciated that GAM569 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM569 target genes. The mRNA of each one of this plurality of GAM569 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM569 RNA, herein designated GAM RNA, and which when bound by GAM569 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM569 target proteins.

[7842] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM569 gene, herein designated GAM GENE, on one or more GAM569 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7843] It is yet further appreciated that specific functions, and accordingly utilities, of GAM569 correlate with, and may be deduced from, the identity of the target genes which GAM569 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7844] Nucleotide sequences of the GAM569 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM569 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM569 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM569 are further described hereinbelow with

reference to Table 1.

[7845] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM569 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7846] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 570 (GAM570) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7847] GAM570 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM570 was detected is described hereinabove with reference to Figs. 2-8.

[7848] GAM570 gene, herein designated GAM GENE, and GAM570 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7849] GAM570 gene, herein designated GAM GENE, encodes a GAM570 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM570 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM570 precursor RNA is designated SEQ ID:547, and is provided

hereinbelow with reference to the sequence listing part.

[7850] GAM570 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM570 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7851] An enzyme complex designated DICER COMPLEX, dices the GAM570 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM570 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM570 RNA is designated SEQ ID:3147, and is provided hereinbelow with reference to the sequence listing part.

[7852] GAM570 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM570 target RNA, herein designated GAM TARGET RNA. GAM570 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[7853] GAM570 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM570 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM570 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM570 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM570 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7854] The complementary binding of GAM570 RNA, herein designated GAM RNA, to target binding sites on GAM570 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM570 target RNA, herein designated GAM TARGET RNA, into GAM570 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7855] It is appreciated that GAM570 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM570 target genes. The mRNA of each one of this plurality of GAM570 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM570 RNA, herein designated GAM RNA, and which when bound by GAM570 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM570 target proteins.

[7856] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM570 gene, herein designated GAM GENE, on one or more GAM570 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7857] It is yet further appreciated that specific functions, and accordingly utilities, of GAM570 correlate with, and may be deduced from, the identity of the target genes which GAM570 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7858] Nucleotide sequences of the GAM570 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM570 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM570 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM570 are further described hereinbelow with reference to Table 1.

[7859] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM570 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7860] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 571 (GAM571) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7861] GAM571 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM571 was detected is described hereinabove with reference to Figs. 2-8.

[7862] GAM571 gene, herein designated GAM GENE, and GAM571 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7863] GAM571 gene, herein designated GAM GENE, encodes a GAM571 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM571 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM571 precursor RNA is designated SEQ ID:548, and is provided hereinbelow with reference to the sequence listing part.

[7864] GAM571 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM571 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7865] An enzyme complex designated DICER COMPLEX, dices the GAM571 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM571 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM571 RNA is designated SEQ ID:3148, and is provided hereinbelow with reference to the sequence listing part.

[7866] GAM571 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM571 target RNA, herein designated

GAM TARGET RNA. GAM571 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7867] GAM571 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM571 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM571 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM571 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM571 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7868] The complementary binding of GAM571 RNA, herein designated GAM RNA, to target binding sites on GAM571 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM571 target RNA, herein designated GAM

TARGET RNA, into GAM571 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7869] It is appreciated that GAM571 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM571 target genes. The mRNA of each one of this plurality of GAM571 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM571 RNA, herein designated GAM RNA, and which when bound by GAM571 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM571 target proteins.

[7870] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM571 gene, herein designated GAM GENE, on one or more GAM571 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7871] It is yet further appreciated that specific functions, and accordingly utilities, of GAM571 correlate with, and may be deduced from, the identity of the target

genes which GAM571 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7872] Nucleotide sequences of the GAM571 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM571 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM571 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM571 are further described hereinbelow with reference to Table 1.

[7873] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM571 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7874] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 572 (GAM572) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7875] GAM572 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM572 was detected is described hereinabove with reference to Figs. 2-8.

[7876] GAM572 gene, herein designated GAM GENE, and GAM572 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[7877] GAM572 gene, herein designated GAM GENE, encodes a GAM572 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM572 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM572 precursor RNA is designated SEQ ID:549, and is provided hereinbelow with reference to the sequence listing part.

[7878] GAM572 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM572 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7879] An enzyme complex designated DICER COMPLEX, dices the GAM572 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM572 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM572 RNA is designated SEQ ID:3149, and is provided

hereinbelow with reference to the sequence listing part.

[7880] GAM572 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM572 target RNA, herein designated GAM TARGET RNA. GAM572 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7881] GAM572 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM572 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM572 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM572 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM572 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7882] The complementary binding of GAM572 RNA, herein designated GAM RNA, to target binding sites on GAM572 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM572 target RNA, herein designated GAM TARGET RNA, into GAM572 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7883] It is appreciated that GAM572 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM572 target genes. The mRNA of each one of this plurality of GAM572 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM572 RNA, herein designated GAM RNA, and which when bound by GAM572 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM572 target proteins.

[7884] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM572 gene, herein designated GAM GENE, on one or more GAM572 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7885] It is yet further appreciated that specific functions, and accordingly utilities, of GAM572 correlate with, and may be deduced from, the identity of the target genes which GAM572 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7886] Nucleotide sequences of the GAM572 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM572 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM572 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM572 are further described hereinbelow with reference to Table 1.

[7887] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM572 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7888] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 573 (GAM573) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7889] GAM573 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM573 was detected is

described hereinabove with reference to Figs. 2-8.

[7890] GAM573 gene, herein designated GAM GENE, and GAM573 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7891] GAM573 gene, herein designated GAM GENE, encodes a GAM573 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM573 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM573 precursor RNA is designated SEQ ID:550, and is provided hereinbelow with reference to the sequence listing part.

[7892] GAM573 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM573 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7893] An enzyme complex designated DICER COMPLEX, dices the GAM573 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM573 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM573 RNA is designated SEQ ID:3150, and is provided hereinbelow with reference to the sequence listing part.

[7894] GAM573 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM573 target RNA, herein designated GAM TARGET RNA. GAM573 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7895] GAM573 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM573 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM573 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM573 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM573 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7896] The complementary binding of GAM573 RNA, herein designated GAM RNA, to target binding sites on GAM573 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM573 target RNA, herein designated GAM TARGET RNA, into GAM573 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7897] It is appreciated that GAM573 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM573 target genes. The mRNA of each one of this plurality of GAM573 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM573 RNA, herein designated GAM RNA, and which when bound by GAM573 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM573 target proteins.

[7898] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM573 gene, herein designated GAM GENE, on one or more GAM573 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7899] It is yet further appreciated that specific functions, and accordingly utilities, of GAM573 correlate with, and may be deduced from, the identity of the target genes which GAM573 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7900] Nucleotide sequences of the GAM573 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM573 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM573 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM573 are further described hereinbelow with reference to Table 1.

[7901] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM573 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7902] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 574 (GAM574) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7903] GAM574 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM574 was detected is described hereinabove with reference to Figs. 2-8.

[7904] GAM574 gene, herein designated GAM GENE, and GAM574 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7905] GAM574 gene, herein designated GAM GENE, encodes a GAM574 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM574 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM574 precursor RNA is designated SEQ ID:551, and is provided hereinbelow with reference to the sequence listing part.

[7906] GAM574 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM574 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7907] An enzyme complex designated DICER COMPLEX, dices the GAM574 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM574 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM574 RNA is designated SEQ ID:3151, and is provided hereinbelow with reference to the sequence listing part.

[7908] GAM574 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM574 target RNA, herein designated GAM TARGET RNA. GAM574 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7909] GAM574 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM574 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM574 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM574 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM574 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7910] The complementary binding of GAM574 RNA, herein designated GAM RNA, to target binding sites on GAM574 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM574 target RNA, herein designated GAM TARGET RNA, into GAM574 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7911] It is appreciated that GAM574 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM574 target genes. The mRNA of each one of this plurality of GAM574 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM574 RNA, herein designated GAM RNA, and which when bound by GAM574 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM574 target proteins.

[7912] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM574 gene, herein designated GAM GENE, on one or more GAM574 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7913] It is yet further appreciated that specific functions, and accordingly utilities, of GAM574 correlate with, and may be deduced from, the identity of the target genes which GAM574 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7914] Nucleotide sequences of the GAM574 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM574 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM574 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM574 are further described hereinbelow with reference to Table 1.

[7915] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM574 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7916] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 575 (GAM575) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7917] GAM575 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM575 was detected is described hereinabove with reference to Figs. 2-8.

[7918] GAM575 gene, herein designated GAM GENE, and GAM575 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7919] GAM575 gene, herein designated GAM GENE, encodes a GAM575 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM575 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM575 precursor RNA is designated SEQ ID:552, and is provided hereinbelow with reference to the sequence listing part.

[7920] GAM575 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM575 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7921] An enzyme complex designated DICER COMPLEX, dices the GAM575 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM575 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM575 RNA is designated SEQ ID:3152, and is provided hereinbelow with reference to the sequence listing part.

[7922] GAM575 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM575 target RNA, herein designated GAM TARGET RNA. GAM575 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7923] GAM575 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM575 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM575 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM575 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM575 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7924] The complementary binding of GAM575 RNA, herein designated GAM RNA, to target binding sites on GAM575 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM575 target RNA, herein designated GAM TARGET RNA, into GAM575 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7925] It is appreciated that GAM575 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM575 target genes. The mRNA of each one of this plurality of GAM575 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM575 RNA, herein designated GAM RNA, and which when bound by GAM575 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM575 target proteins.

[7926] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM575 gene, herein designated GAM GENE, on one or more

GAM575 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7927] It is yet further appreciated that specific functions, and accordingly utilities, of GAM575 correlate with, and may be deduced from, the identity of the target genes which GAM575 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7928] Nucleotide sequences of the GAM575 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM575 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM575 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM575 are further described hereinbelow with reference to Table 1.

[7929] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM575 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7930] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 576 (GAM576) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7931] GAM576 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM576 was detected is described hereinabove with reference to Figs. 2-8.

[7932] GAM576 gene, herein designated GAM GENE, and GAM576 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7933] GAM576 gene, herein designated GAM GENE, encodes a GAM576 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM576 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM576 precursor RNA is designated SEQ ID:553, and is provided hereinbelow with reference to the sequence listing part.

[7934] GAM576 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM576 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7935] An enzyme complex designated DICER COMPLEX, dices the GAM576 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM576 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM576 RNA is designated SEQ ID:3153, and is provided hereinbelow with reference to the sequence listing part.

[7936] GAM576 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM576 target RNA, herein designated GAM TARGET RNA. GAM576 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7937] GAM576 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM576 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM576 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM576 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM576 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7938] The complementary binding of GAM576 RNA, herein designated GAM RNA, to target binding sites on GAM576 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM576 target RNA, herein designated GAM TARGET RNA, into GAM576 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7939] It is appreciated that GAM576 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM576 target genes. The mRNA of each one of this plurality of GAM576 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM576 RNA, herein designated GAM RNA, and which when bound by GAM576 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM576 target proteins.

[7940] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM576 gene, herein designated GAM GENE, on one or more GAM576 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7941] It is yet further appreciated that specific functions, and accordingly utilities, of GAM576 correlate with, and may be deduced from, the identity of the target genes which GAM576 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7942] Nucleotide sequences of the GAM576 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM576 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM576 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM576 are further described hereinbelow with reference to Table 1.

[7943] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM576 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7944] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 577 (GAM577) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7945] GAM577 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM577 was detected is described hereinabove with reference to Figs. 2-8.

[7946] GAM577 gene, herein designated GAM GENE, and GAM577 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7947] GAM577 gene, herein designated GAM GENE, encodes a GAM577 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM577 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM577 precursor RNA is designated SEQ ID:554, and is provided hereinbelow with reference to the sequence listing part.

[7948] GAM577 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM577 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7949] An enzyme complex designated DICER COMPLEX, dices the GAM577 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM577 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM577 RNA is designated SEQ ID:3154, and is provided hereinbelow with reference to the sequence listing part.

[7950] GAM577 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM577 target RNA, herein designated GAM TARGET RNA. GAM577 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7951] GAM577 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM577

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM577 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM577 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM577 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7952] The complementary binding of GAM577 RNA, herein designated GAM RNA, to target binding sites on GAM577 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM577 target RNA, herein designated GAM TARGET RNA, into GAM577 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7953] It is appreciated that GAM577 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM577 target genes. The mRNA of each one of this plurality of GAM577 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM577 RNA, herein designated GAM RNA, and which when bound by GAM577 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM577 target proteins.

[7954] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM577 gene, herein designated GAM GENE, on one or more GAM577 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7955] It is yet further appreciated that specific functions, and accordingly utilities, of GAM577 correlate with, and may be deduced from, the identity of the target genes which GAM577 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7956] Nucleotide sequences of the GAM577 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM577 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM577 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM577 are further described hereinbelow with

reference to Table 1.

[7957] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM577 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7958] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 578 (GAM578) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7959] GAM578 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM578 was detected is described hereinabove with reference to Figs. 2-8.

[7960] GAM578 gene, herein designated GAM GENE, and GAM578 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7961] GAM578 gene, herein designated GAM GENE, encodes a GAM578 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM578 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM578 precursor RNA is designated SEQ ID:555, and is provided

hereinbelow with reference to the sequence listing part.

[7962] GAM578 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM578 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7963] An enzyme complex designated DICER COMPLEX, dices the GAM578 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM578 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM578 RNA is designated SEQ ID:3155, and is provided hereinbelow with reference to the sequence listing part.

[7964] GAM578 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM578 target RNA, herein designated GAM TARGET RNA. GAM578 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[7965] GAM578 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM578 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM578 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM578 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM578 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7966] The complementary binding of GAM578 RNA, herein designated GAM RNA, to target binding sites on GAM578 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM578 target RNA, herein designated GAM TARGET RNA, into GAM578 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7967] It is appreciated that GAM578 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM578 target genes. The mRNA of each one of this plurality of GAM578 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM578 RNA, herein designated GAM RNA, and which when bound by GAM578 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM578 target proteins.

[7968] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM578 gene, herein designated GAM GENE, on one or more GAM578 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7969] It is yet further appreciated that specific functions, and accordingly utilities, of GAM578 correlate with, and may be deduced from, the identity of the target genes which GAM578 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7970] Nucleotide sequences of the GAM578 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM578 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM578 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM578 are further described hereinbelow with reference to Table 1.

[7971] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM578 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7972] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 579 (GAM579) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7973] GAM579 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM579 was detected is described hereinabove with reference to Figs. 2-8.

[7974] GAM579 gene, herein designated GAM GENE, and GAM579 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[7975] GAM579 gene, herein designated GAM GENE, encodes a GAM579 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM579 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM579 precursor RNA is designated SEQ ID:556, and is provided hereinbelow with reference to the sequence listing part.

[7976] GAM579 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM579 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7977] An enzyme complex designated DICER COMPLEX, dices the GAM579 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM579 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM579 RNA is designated SEQ ID:3157, and is provided hereinbelow with reference to the sequence listing part.

[7978] GAM579 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM579 target RNA, herein designated

GAM TARGET RNA. GAM579 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7979] GAM579 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM579 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM579 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM579 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM579 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7980] The complementary binding of GAM579 RNA, herein designated GAM RNA, to target binding sites on GAM579 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM579 target RNA, herein designated GAM

TARGET RNA, into GAM579 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7981] It is appreciated that GAM579 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM579 target genes. The mRNA of each one of this plurality of GAM579 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM579 RNA, herein designated GAM RNA, and which when bound by GAM579 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM579 target proteins.

[7982] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM579 gene, herein designated GAM GENE, on one or more GAM579 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7983] It is yet further appreciated that specific functions, and accordingly utilities, of GAM579 correlate with, and may be deduced from, the identity of the target

genes which GAM579 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7984] Nucleotide sequences of the GAM579 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM579 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM579 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM579 are further described hereinbelow with reference to Table 1.

[7985] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM579 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[7986] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 580 (GAM580) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[7987] GAM580 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM580 was detected is described hereinabove with reference to Figs. 2-8.

[7988] GAM580 gene, herein designated GAM GENE, and GAM580 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[7989] GAM580 gene, herein designated GAM GENE, encodes a GAM580 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM580 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM580 precursor RNA is designated SEQ ID:557, and is provided hereinbelow with reference to the sequence listing part.

[7990] GAM580 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM580 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7991] An enzyme complex designated DICER COMPLEX, dices the GAM580 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM580 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM580 RNA is designated SEQ ID:3156, and is provided

hereinbelow with reference to the sequence listing part.

[7992] GAM580 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM580 target RNA, herein designated GAM TARGET RNA. GAM580 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7993] GAM580 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM580 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM580 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM580 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM580 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7994] The complementary binding of GAM580 RNA, herein designated GAM RNA, to target binding sites on GAM580 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM580 target RNA, herein designated GAM TARGET RNA, into GAM580 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[7995] It is appreciated that GAM580 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM580 target genes. The mRNA of each one of this plurality of GAM580 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM580 RNA, herein designated GAM RNA, and which when bound by GAM580 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM580 target proteins.

[7996] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM580 gene, herein designated GAM GENE, on one or more GAM580 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7997] It is yet further appreciated that specific functions, and accordingly utilities, of GAM580 correlate with, and may be deduced from, the identity of the target genes which GAM580 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7998] Nucleotide sequences of the GAM580 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM580 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM580 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM580 are further described hereinbelow with reference to Table 1.

[7999] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM580 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8000] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 581 (GAM581) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8001] GAM581 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM581 was detected is

described hereinabove with reference to Figs. 2-8.

[8002] GAM581 gene, herein designated GAM GENE, and GAM581 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8003] GAM581 gene, herein designated GAM GENE, encodes a GAM581 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM581 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM581 precursor RNA is designated SEQ ID:558, and is provided hereinbelow with reference to the sequence listing part.

[8004] GAM581 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM581 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8005] An enzyme complex designated DICER COMPLEX, dices the GAM581 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM581 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM581 RNA is designated SEQ ID:3158, and is provided hereinbelow with reference to the sequence listing part.

[8006] GAM581 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM581 target RNA, herein designated GAM TARGET RNA. GAM581 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8007] GAM581 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM581 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM581 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM581 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM581 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8008] The complementary binding of GAM581 RNA, herein designated GAM RNA, to target binding sites on GAM581 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM581 target RNA, herein designated GAM TARGET RNA, into GAM581 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8009] It is appreciated that GAM581 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM581 target genes. The mRNA of each one of this plurality of GAM581 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM581 RNA, herein designated GAM RNA, and which when bound by GAM581 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM581 target proteins.

[8010] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM581 gene, herein designated GAM GENE, on one or more GAM581 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8011] It is yet further appreciated that specific functions, and accordingly utilities, of GAM581 correlate with, and may be deduced from, the identity of the target genes which GAM581 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8012] Nucleotide sequences of the GAM581 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM581 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM581 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM581 are further described hereinbelow with reference to Table 1.

[8013] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM581 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8014] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 582 (GAM582) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8015] GAM582 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM582 was detected is described hereinabove with reference to Figs. 2-8.

[8016] GAM582 gene, herein designated GAM GENE, and GAM582 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8017] GAM582 gene, herein designated GAM GENE, encodes a GAM582 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM582 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM582 precursor RNA is designated SEQ ID:559, and is provided hereinbelow with reference to the sequence listing part.

[8018] GAM582 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM582 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8019] An enzyme complex designated DICER COMPLEX, dices the GAM582 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM582 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM582 RNA is designated SEQ ID:3160, and is provided hereinbelow with reference to the sequence listing part.

[8020] GAM582 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM582 target RNA, herein designated GAM TARGET RNA. GAM582 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8021] GAM582 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM582 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM582 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM582 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM582 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8022] The complementary binding of GAM582 RNA, herein designated GAM RNA, to target binding sites on GAM582 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM582 target RNA, herein designated GAM TARGET RNA, into GAM582 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8023] It is appreciated that GAM582 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM582 target genes. The mRNA of each one of this plurality of GAM582 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM582 RNA, herein designated GAM RNA, and which when bound by GAM582 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM582 target proteins.

[8024] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM582 gene, herein designated GAM GENE, on one or more GAM582 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8025] It is yet further appreciated that specific functions, and accordingly utilities, of GAM582 correlate with, and may be deduced from, the identity of the target genes which GAM582 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8026] Nucleotide sequences of the GAM582 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM582 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM582 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM582 are further described hereinbelow with reference to Table 1.

[8027] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM582 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8028] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 583 (GAM583) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8029] GAM583 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM583 was detected is described hereinabove with reference to Figs. 2-8.

[8030] GAM583 gene, herein designated GAM GENE, and GAM583 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8031] GAM583 gene, herein designated GAM GENE, encodes a GAM583 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM583 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM583 precursor RNA is designated SEQ ID:560, and is provided hereinbelow with reference to the sequence listing part.

[8032] GAM583 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM583 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8033] An enzyme complex designated DICER COMPLEX, dices the GAM583 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM583 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM583 RNA is designated SEQ ID:3159, and is provided hereinbelow with reference to the sequence listing part.

[8034] GAM583 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM583 target RNA, herein designated GAM TARGET RNA. GAM583 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8035] GAM583 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM583 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM583 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM583 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM583 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8036] The complementary binding of GAM583 RNA, herein designated GAM RNA, to target binding sites on GAM583 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM583 target RNA, herein designated GAM TARGET RNA, into GAM583 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8037] It is appreciated that GAM583 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM583 target genes. The mRNA of each one of this plurality of GAM583 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM583 RNA, herein designated GAM RNA, and which when bound by GAM583 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM583 target proteins.

[8038] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM583 gene, herein designated GAM GENE, on one or more

GAM583 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8039] It is yet further appreciated that specific functions, and accordingly utilities, of GAM583 correlate with, and may be deduced from, the identity of the target genes which GAM583 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8040] Nucleotide sequences of the GAM583 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM583 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM583 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM583 are further described hereinbelow with reference to Table 1.

[8041] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM583 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8042] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 584 (GAM584) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8043] GAM584 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM584 was detected is described hereinabove with reference to Figs. 2-8.

[8044] GAM584 gene, herein designated GAM GENE, and GAM584 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8045] GAM584 gene, herein designated GAM GENE, encodes a GAM584 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM584 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM584 precursor RNA is designated SEQ ID:561, and is provided hereinbelow with reference to the sequence listing part.

[8046] GAM584 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM584 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8047] An enzyme complex designated DICER COMPLEX, dices the GAM584 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM584 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM584 RNA is designated SEQ ID:3161, and is provided hereinbelow with reference to the sequence listing part.

[8048] GAM584 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM584 target RNA, herein designated GAM TARGET RNA. GAM584 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8049] GAM584 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM584 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM584 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM584 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM584 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8050] The complementary binding of GAM584 RNA, herein designated GAM RNA, to target binding sites on GAM584 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM584 target RNA, herein designated GAM TARGET RNA, into GAM584 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8051] It is appreciated that GAM584 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM584 target genes. The mRNA of each one of this plurality of GAM584 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM584 RNA, herein designated GAM RNA, and which when bound by GAM584 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM584 target proteins.

[8052] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM584 gene, herein designated GAM GENE, on one or more GAM584 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8053] It is yet further appreciated that specific functions, and accordingly utilities, of GAM584 correlate with, and may be deduced from, the identity of the target genes which GAM584 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8054] Nucleotide sequences of the GAM584 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM584 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM584 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM584 are further described hereinbelow with reference to Table 1.

[8055] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM584 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8056] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 585 (GAM585) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8057] GAM585 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM585 was detected is described hereinabove with reference to Figs. 2-8.

[8058] GAM585 gene, herein designated GAM GENE, and GAM585 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8059] GAM585 gene, herein designated GAM GENE, encodes a GAM585 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM585 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM585 precursor RNA is designated SEQ ID:562, and is provided hereinbelow with reference to the sequence listing part.

[8060] GAM585 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM585 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8061] An enzyme complex designated DICER COMPLEX, dices the GAM585 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM585 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM585 RNA is designated SEQ ID:3162, and is provided hereinbelow with reference to the sequence listing part.

[8062] GAM585 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM585 target RNA, herein designated GAM TARGET RNA. GAM585 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8063] GAM585 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM585

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM585 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM585 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM585 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8064] The complementary binding of GAM585 RNA, herein designated GAM RNA, to target binding sites on GAM585 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM585 target RNA, herein designated GAM TARGET RNA, into GAM585 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8065] It is appreciated that GAM585 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM585 target genes. The mRNA of each one of this plurality of GAM585 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM585 RNA, herein designated GAM RNA, and which when bound by GAM585 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM585 target proteins.

[8066] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM585 gene, herein designated GAM GENE, on one or more GAM585 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8067] It is yet further appreciated that specific functions, and accordingly utilities, of GAM585 correlate with, and may be deduced from, the identity of the target genes which GAM585 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8068] Nucleotide sequences of the GAM585 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM585 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM585 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM585 are further described hereinbelow with

reference to Table 1.

[8069] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM585 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8070] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 586 (GAM586) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8071] GAM586 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM586 was detected is described hereinabove with reference to Figs. 2-8.

[8072] GAM586 gene, herein designated GAM GENE, and GAM586 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8073] GAM586 gene, herein designated GAM GENE, encodes a GAM586 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM586 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM586 precursor RNA is designated SEQ ID:563, and is provided

hereinbelow with reference to the sequence listing part.

[8074] GAM586 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM586 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8075] An enzyme complex designated DICER COMPLEX, dices the GAM586 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM586 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM586 RNA is designated SEQ ID:3163, and is provided hereinbelow with reference to the sequence listing part.

[8076] GAM586 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM586 target RNA, herein designated GAM TARGET RNA. GAM586 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[8077] GAM586 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM586 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM586 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM586 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM586 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8078] The complementary binding of GAM586 RNA, herein designated GAM RNA, to target binding sites on GAM586 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM586 target RNA, herein designated GAM TARGET RNA, into GAM586 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8079] It is appreciated that GAM586 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM586 target genes. The mRNA of each one of this plurality of GAM586 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM586 RNA, herein designated GAM RNA, and which when bound by GAM586 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM586 target proteins.

[8080] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM586 gene, herein designated GAM GENE, on one or more GAM586 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8081] It is yet further appreciated that specific functions, and accordingly utilities, of GAM586 correlate with, and may be deduced from, the identity of the target genes which GAM586 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8082] Nucleotide sequences of the GAM586 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM586 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM586 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM586 are further described hereinbelow with reference to Table 1.

[8083] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM586 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8084] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 587 (GAM587) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8085] GAM587 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM587 was detected is described hereinabove with reference to Figs. 2-8.

[8086] GAM587 gene, herein designated GAM GENE, and GAM587 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8087] GAM587 gene, herein designated GAM GENE, encodes a GAM587 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM587 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM587 precursor RNA is designated SEQ ID:564, and is provided hereinbelow with reference to the sequence listing part.

[8088] GAM587 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM587 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8089] An enzyme complex designated DICER COMPLEX, dices the GAM587 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM587 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM587 RNA is designated SEQ ID:3164, and is provided hereinbelow with reference to the sequence listing part.

[8090] GAM587 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM587 target RNA, herein designated

GAM TARGET RNA. GAM587 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8091] GAM587 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM587 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM587 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM587 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM587 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8092] The complementary binding of GAM587 RNA, herein designated GAM RNA, to target binding sites on GAM587 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM587 target RNA, herein designated GAM

TARGET RNA, into GAM587 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8093] It is appreciated that GAM587 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM587 target genes. The mRNA of each one of this plurality of GAM587 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM587 RNA, herein designated GAM RNA, and which when bound by GAM587 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM587 target proteins.

[8094] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM587 gene, herein designated GAM GENE, on one or more GAM587 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8095] It is yet further appreciated that specific functions, and accordingly utilities, of GAM587 correlate with, and may be deduced from, the identity of the target

genes which GAM587 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8096] Nucleotide sequences of the GAM587 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM587 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM587 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM587 are further described hereinbelow with reference to Table 1.

[8097] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM587 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8098] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 588 (GAM588) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8099] GAM588 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM588 was detected is described hereinabove with reference to Figs. 2-8.

[8100] GAM588 gene, herein designated GAM GENE, and GAM588 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[8101] GAM588 gene, herein designated GAM GENE, encodes a GAM588 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM588 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM588 precursor RNA is designated SEQ ID:565, and is provided hereinbelow with reference to the sequence listing part.

[8102] GAM588 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM588 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8103] An enzyme complex designated DICER COMPLEX, dices the GAM588 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM588 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM588 RNA is designated SEQ ID:3165, and is provided

hereinbelow with reference to the sequence listing part.

[8104] GAM588 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM588 target RNA, herein designated GAM TARGET RNA. GAM588 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8105] GAM588 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM588 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM588 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM588 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM588 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8106] The complementary binding of GAM588 RNA, herein designated GAM RNA, to target binding sites on GAM588 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM588 target RNA, herein designated GAM TARGET RNA, into GAM588 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8107] It is appreciated that GAM588 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM588 target genes. The mRNA of each one of this plurality of GAM588 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM588 RNA, herein designated GAM RNA, and which when bound by GAM588 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM588 target proteins.

[8108] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM588 gene, herein designated GAM GENE, on one or more GAM588 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8109] It is yet further appreciated that specific functions, and accordingly utilities, of GAM588 correlate with, and may be deduced from, the identity of the target genes which GAM588 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8110] Nucleotide sequences of the GAM588 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM588 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM588 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM588 are further described hereinbelow with reference to Table 1.

[8111] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM588 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8112] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 589 (GAM589) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8113] GAM589 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM589 was detected is

described hereinabove with reference to Figs. 2-8.

[8114] GAM589 gene, herein designated GAM GENE, and GAM589 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8115] GAM589 gene, herein designated GAM GENE, encodes a GAM589 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM589 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM589 precursor RNA is designated SEQ ID:566, and is provided hereinbelow with reference to the sequence listing part.

[8116] GAM589 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM589 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8117] An enzyme complex designated DICER COMPLEX, dices the GAM589 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM589 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM589 RNA is designated SEQ ID:3166, and is provided hereinbelow with reference to the sequence listing part.

[8118] GAM589 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM589 target RNA, herein designated GAM TARGET RNA. GAM589 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8119] GAM589 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM589 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM589 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM589 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM589 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8120] The complementary binding of GAM589 RNA, herein designated GAM RNA, to target binding sites on GAM589 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM589 target RNA, herein designated GAM TARGET RNA, into GAM589 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8121] It is appreciated that GAM589 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM589 target genes. The mRNA of each one of this plurality of GAM589 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM589 RNA, herein designated GAM RNA, and which when bound by GAM589 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM589 target proteins.

[8122] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM589 gene, herein designated GAM GENE, on one or more GAM589 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8123] It is yet further appreciated that specific functions, and accordingly utilities, of GAM589 correlate with, and may be deduced from, the identity of the target genes which GAM589 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8124] Nucleotide sequences of the GAM589 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM589 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM589 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM589 are further described hereinbelow with reference to Table 1.

[8125] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM589 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8126] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 590 (GAM590) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8127] GAM590 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM590 was detected is described hereinabove with reference to Figs. 2-8.

[8128] GAM590 gene, herein designated GAM GENE, and GAM590 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8129] GAM590 gene, herein designated GAM GENE, encodes a GAM590 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM590 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM590 precursor RNA is designated SEQ ID:567, and is provided hereinbelow with reference to the sequence listing part.

[8130] GAM590 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM590 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8131] An enzyme complex designated DICER COMPLEX, dices the GAM590 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM590 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM590 RNA is designated SEQ ID:3167, and is provided hereinbelow with reference to the sequence listing part.

[8132] GAM590 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM590 target RNA, herein designated GAM TARGET RNA. GAM590 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8133] GAM590 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM590 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM590 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM590 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM590 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8134] The complementary binding of GAM590 RNA, herein designated GAM RNA, to target binding sites on GAM590 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM590 target RNA, herein designated GAM TARGET RNA, into GAM590 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8135] It is appreciated that GAM590 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM590 target genes. The mRNA of each one of this plurality of GAM590 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM590 RNA, herein designated GAM RNA, and which when bound by GAM590 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM590 target proteins.

[8136] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM590 gene, herein designated GAM GENE, on one or more GAM590 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8137] It is yet further appreciated that specific functions, and accordingly utilities, of GAM590 correlate with, and may be deduced from, the identity of the target genes which GAM590 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8138] Nucleotide sequences of the GAM590 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM590 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM590 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM590 are further described hereinbelow with reference to Table 1.

[8139] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM590 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8140] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 591 (GAM591) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8141] GAM591 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM591 was detected is described hereinabove with reference to Figs. 2-8.

[8142] GAM591 gene, herein designated GAM GENE, and GAM591 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8143] GAM591 gene, herein designated GAM GENE, encodes a GAM591 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM591 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM591 precursor RNA is designated SEQ ID:568, and is provided hereinbelow with reference to the sequence listing part.

[8144] GAM591 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8145] An enzyme complex designated DICER COMPLEX, dices the GAM591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM591 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM591 RNA is designated SEQ ID:3168, and is provided hereinbelow with reference to the sequence listing part.

[8146] GAM591 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM591 target RNA, herein designated GAM TARGET RNA. GAM591 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8147] GAM591 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM591 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM591 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM591 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM591 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8148] The complementary binding of GAM591 RNA, herein designated GAM RNA, to target binding sites on GAM591 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM591 target RNA, herein designated GAM TARGET RNA, into GAM591 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8149] It is appreciated that GAM591 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM591 target genes. The mRNA of each one of this plurality of GAM591 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM591 RNA, herein designated GAM RNA, and which when bound by GAM591 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM591 target proteins.

[8150] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM591 gene, herein designated GAM GENE, on one or more

GAM591 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8151] It is yet further appreciated that specific functions, and accordingly utilities, of GAM591 correlate with, and may be deduced from, the identity of the target genes which GAM591 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8152] Nucleotide sequences of the GAM591 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM591 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM591 are further described hereinbelow with reference to Table 1.

[8153] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM591 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8154] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 592 (GAM592) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8155] GAM592 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM592 was detected is described hereinabove with reference to Figs. 2-8.

[8156] GAM592 gene, herein designated GAM GENE, and GAM592 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8157] GAM592 gene, herein designated GAM GENE, encodes a GAM592 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM592 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM592 precursor RNA is designated SEQ ID:569, and is provided hereinbelow with reference to the sequence listing part.

[8158] GAM592 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM592 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8159] An enzyme complex designated DICER COMPLEX, dices the GAM592 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM592 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM592 RNA is designated SEQ ID:3169, and is provided hereinbelow with reference to the sequence listing part.

[8160] GAM592 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM592 target RNA, herein designated GAM TARGET RNA. GAM592 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8161] GAM592 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM592 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM592 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM592 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM592 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8162] The complementary binding of GAM592 RNA, herein designated GAM RNA, to target binding sites on GAM592 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM592 target RNA, herein designated GAM TARGET RNA, into GAM592 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8163] It is appreciated that GAM592 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM592 target genes. The mRNA of each one of this plurality of GAM592 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM592 RNA, herein designated GAM RNA, and which when bound by GAM592 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM592 target proteins.

[8164] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM592 gene, herein designated GAM GENE, on one or more GAM592 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8165] It is yet further appreciated that specific functions, and accordingly utilities, of GAM592 correlate with, and may be deduced from, the identity of the target genes which GAM592 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8166] Nucleotide sequences of the GAM592 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM592 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM592 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM592 are further described hereinbelow with reference to Table 1.

[8167] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM592 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8168] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 593 (GAM593) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8169] GAM593 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM593 was detected is described hereinabove with reference to Figs. 2-8.

[8170] GAM593 gene, herein designated GAM GENE, and GAM593 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8171] GAM593 gene, herein designated GAM GENE, encodes a GAM593 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM593 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM593 precursor RNA is designated SEQ ID:570, and is provided hereinbelow with reference to the sequence listing part.

[8172] GAM593 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM593 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8173] An enzyme complex designated DICER COMPLEX, dices the GAM593 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM593 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM593 RNA is designated SEQ ID:3170, and is provided hereinbelow with reference to the sequence listing part.

[8174] GAM593 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM593 target RNA, herein designated GAM TARGET RNA. GAM593 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8175] GAM593 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM593

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM593 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM593 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM593 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8176] The complementary binding of GAM593 RNA, herein designated GAM RNA, to target binding sites on GAM593 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM593 target RNA, herein designated GAM TARGET RNA, into GAM593 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8177] It is appreciated that GAM593 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM593 target genes. The mRNA of each one of this plurality of GAM593 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM593 RNA, herein designated GAM RNA, and which when bound by GAM593 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM593 target proteins.

[8178] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM593 gene, herein designated GAM GENE, on one or more GAM593 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8179] It is yet further appreciated that specific functions, and accordingly utilities, of GAM593 correlate with, and may be deduced from, the identity of the target genes which GAM593 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8180] Nucleotide sequences of the GAM593 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM593 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM593 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM593 are further described hereinbelow with reference to Table 1.

[8181] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM593 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8182] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 594 (GAM594) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8183] GAM594 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM594 was detected is described hereinabove with reference to Figs. 2-8.

[8184] GAM594 gene, herein designated GAM GENE, and GAM594 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8185] GAM594 gene, herein designated GAM GENE, encodes a GAM594 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM594 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM594 precursor RNA is designated SEQ ID:571, and is provided hereinbelow with reference to the sequence listing part.

[8186] GAM594 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM594 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8187] An enzyme complex designated DICER COMPLEX, dices the GAM594 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM594 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM594 RNA is designated SEQ ID:3171, and is provided hereinbelow with reference to the sequence listing part.

[8188] GAM594 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM594 target RNA, herein designated GAM TARGET RNA. GAM594 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8189] GAM594 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM594

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM594 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM594 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM594 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8190] The complementary binding of GAM594 RNA, herein designated GAM RNA, to target binding sites on GAM594 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM594 target RNA, herein designated GAM TARGET RNA, into GAM594 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8191] It is appreciated that GAM594 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM594 target genes. The mRNA of each one of this plurality of GAM594 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM594 RNA, herein designated GAM RNA, and which when bound by GAM594 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM594 target proteins.

[8192] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM594 gene, herein designated GAM GENE, on one or more GAM594 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8193] It is yet further appreciated that specific functions, and accordingly utilities, of GAM594 correlate with, and may be deduced from, the identity of the target genes which GAM594 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8194] Nucleotide sequences of the GAM594 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM594 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM594 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM594 are further described hereinbelow with

reference to Table 1.

[8195] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM594 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8196] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 595 (GAM595) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8197] GAM595 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM595 was detected is described hereinabove with reference to Figs. 2-8.

[8198] GAM595 gene, herein designated GAM GENE, and GAM595 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8199] GAM595 gene, herein designated GAM GENE, encodes a GAM595 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM595 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM595 precursor RNA is designated SEQ ID:572, and is provided

hereinbelow with reference to the sequence listing part.

[8200] GAM595 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM595 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8201] An enzyme complex designated DICER COMPLEX, dices the GAM595 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM595 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM595 RNA is designated SEQ ID:3172, and is provided hereinbelow with reference to the sequence listing part.

[8202] GAM595 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM595 target RNA, herein designated GAM TARGET RNA. GAM595 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[8203] GAM595 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM595 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM595 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM595 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM595 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8204] The complementary binding of GAM595 RNA, herein designated GAM RNA, to target binding sites on GAM595 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM595 target RNA, herein designated GAM TARGET RNA, into GAM595 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8205] It is appreciated that GAM595 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM595 target genes. The mRNA of each one of this plurality of GAM595 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM595 RNA, herein designated GAM RNA, and which when bound by GAM595 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM595 target proteins.

[8206] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM595 gene, herein designated GAM GENE, on one or more GAM595 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8207] It is yet further appreciated that specific functions, and accordingly utilities, of GAM595 correlate with, and may be deduced from, the identity of the target genes which GAM595 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8208] Nucleotide sequences of the GAM595 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM595 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM595 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM595 are further described hereinbelow with reference to Table 1.

[8209] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM595 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8210] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 596 (GAM596) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8211] GAM596 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM596 was detected is described hereinabove with reference to Figs. 2-8.

[8212] GAM596 gene, herein designated GAM GENE, and GAM596 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8213] GAM596 gene, herein designated GAM GENE, encodes a GAM596 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM596 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM596 precursor RNA is designated SEQ ID:573, and is provided hereinbelow with reference to the sequence listing part.

[8214] GAM596 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM596 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8215] An enzyme complex designated DICER COMPLEX, dices the GAM596 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM596 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM596 RNA is designated SEQ ID:3173, and is provided hereinbelow with reference to the sequence listing part.

[8216] GAM596 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM596 target RNA, herein designated

GAM TARGET RNA. GAM596 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8217] GAM596 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM596 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM596 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM596 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM596 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8218] The complementary binding of GAM596 RNA, herein designated GAM RNA, to target binding sites on GAM596 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM596 target RNA, herein designated GAM

TARGET RNA, into GAM596 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8219] It is appreciated that GAM596 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM596 target genes. The mRNA of each one of this plurality of GAM596 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM596 RNA, herein designated GAM RNA, and which when bound by GAM596 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM596 target proteins.

[8220] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM596 gene, herein designated GAM GENE, on one or more GAM596 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8221] It is yet further appreciated that specific functions, and accordingly utilities, of GAM596 correlate with, and may be deduced from, the identity of the target

genes which GAM596 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8222] Nucleotide sequences of the GAM596 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM596 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM596 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM596 are further described hereinbelow with reference to Table 1.

[8223] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM596 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8224] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 597 (GAM597) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8225] GAM597 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM597 was detected is described hereinabove with reference to Figs. 2-8.

[8226] GAM597 gene, herein designated GAM GENE, and GAM597 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[8227] GAM597 gene, herein designated GAM GENE, encodes a GAM597 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM597 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM597 precursor RNA is designated SEQ ID:574, and is provided hereinbelow with reference to the sequence listing part.

[8228] GAM597 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM597 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8229] An enzyme complex designated DICER COMPLEX, dices the GAM597 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM597 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM597 RNA is designated SEQ ID:3174, and is provided

hereinbelow with reference to the sequence listing part.

[8230] GAM597 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM597 target RNA, herein designated GAM TARGET RNA. GAM597 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8231] GAM597 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM597 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM597 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM597 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM597 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8232] The complementary binding of GAM597 RNA, herein designated GAM RNA, to target binding sites on GAM597 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM597 target RNA, herein designated GAM TARGET RNA, into GAM597 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8233] It is appreciated that GAM597 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM597 target genes. The mRNA of each one of this plurality of GAM597 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM597 RNA, herein designated GAM RNA, and which when bound by GAM597 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM597 target proteins.

[8234] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM597 gene, herein designated GAM GENE, on one or more GAM597 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8235] It is yet further appreciated that specific functions, and accordingly utilities, of GAM597 correlate with, and may be deduced from, the identity of the target genes which GAM597 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8236] Nucleotide sequences of the GAM597 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM597 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM597 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM597 are further described hereinbelow with reference to Table 1.

[8237] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM597 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8238] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 598 (GAM598) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8239] GAM598 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM598 was detected is

described hereinabove with reference to Figs. 2-8.

[8240] GAM598 gene, herein designated GAM GENE, and GAM598 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8241] GAM598 gene, herein designated GAM GENE, encodes a GAM598 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM598 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM598 precursor RNA is designated SEQ ID:575, and is provided hereinbelow with reference to the sequence listing part.

[8242] GAM598 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM598 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8243] An enzyme complex designated DICER COMPLEX, dices the GAM598 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM598 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM598 RNA is designated SEQ ID:3175, and is provided hereinbelow with reference to the sequence listing part.

[8244] GAM598 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM598 target RNA, herein designated GAM TARGET RNA. GAM598 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8245] GAM598 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM598 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM598 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM598 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM598 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8246] The complementary binding of GAM598 RNA, herein designated GAM RNA, to target binding sites on GAM598 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM598 target RNA, herein designated GAM TARGET RNA, into GAM598 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8247] It is appreciated that GAM598 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM598 target genes. The mRNA of each one of this plurality of GAM598 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM598 RNA, herein designated GAM RNA, and which when bound by GAM598 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM598 target proteins.

[8248] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM598 gene, herein designated GAM GENE, on one or more GAM598 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8249] It is yet further appreciated that specific functions, and accordingly utilities, of GAM598 correlate with, and may be deduced from, the identity of the target genes which GAM598 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8250] Nucleotide sequences of the GAM598 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM598 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM598 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM598 are further described hereinbelow with reference to Table 1.

[8251] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM598 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8252] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 599 (GAM599) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8253] GAM599 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM599 was detected is described hereinabove with reference to Figs. 2-8.

[8254] GAM599 gene, herein designated GAM GENE, and GAM599 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8255] GAM599 gene, herein designated GAM GENE, encodes a GAM599 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM599 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM599 precursor RNA is designated SEQ ID:576, and is provided hereinbelow with reference to the sequence listing part.

[8256] GAM599 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM599 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8257] An enzyme complex designated DICER COMPLEX, dices the GAM599 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM599 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM599 RNA is designated SEQ ID:3176, and is provided hereinbelow with reference to the sequence listing part.

[8258] GAM599 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM599 target RNA, herein designated GAM TARGET RNA. GAM599 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8259] GAM599 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM599 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM599 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM599 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM599 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8260] The complementary binding of GAM599 RNA, herein designated GAM RNA, to target binding sites on GAM599 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM599 target RNA, herein designated GAM TARGET RNA, into GAM599 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8261] It is appreciated that GAM599 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM599 target genes. The mRNA of each one of this plurality of GAM599 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM599 RNA, herein designated GAM RNA, and which when bound by GAM599 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM599 target proteins.

[8262] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM599 gene, herein designated GAM GENE, on one or more GAM599 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8263] It is yet further appreciated that specific functions, and accordingly utilities, of GAM599 correlate with, and may be deduced from, the identity of the target genes which GAM599 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8264] Nucleotide sequences of the GAM599 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM599 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM599 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM599 are further described hereinbelow with reference to Table 1.

[8265] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM599 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8266] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 600 (GAM600) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8267] GAM600 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM600 was detected is described hereinabove with reference to Figs. 2-8.

[8268] GAM600 gene, herein designated GAM GENE, and GAM600 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8269] GAM600 gene, herein designated GAM GENE, encodes a GAM600 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM600 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM600 precursor RNA is designated SEQ ID:577, and is provided hereinbelow with reference to the sequence listing part.

[8270] GAM600 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM600 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8271] An enzyme complex designated DICER COMPLEX, dices the GAM600 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM600 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM600 RNA is designated SEQ ID:3177, and is provided hereinbelow with reference to the sequence listing part.

[8272] GAM600 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM600 target RNA, herein designated GAM TARGET RNA. GAM600 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8273] GAM600 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM600 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM600 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM600 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM600 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8274] The complementary binding of GAM600 RNA, herein designated GAM RNA, to target binding sites on GAM600 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM600 target RNA, herein designated GAM TARGET RNA, into GAM600 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8275] It is appreciated that GAM600 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM600 target genes. The mRNA of each one of this plurality of GAM600 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM600 RNA, herein designated GAM RNA, and which when bound by GAM600 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM600 target proteins.

[8276] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM600 gene, herein designated GAM GENE, on one or more

GAM600 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8277] It is yet further appreciated that specific functions, and accordingly utilities, of GAM600 correlate with, and may be deduced from, the identity of the target genes which GAM600 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8278] Nucleotide sequences of the GAM600 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM600 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM600 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM600 are further described hereinbelow with reference to Table 1.

[8279] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM600 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8280] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 601 (GAM601) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8281] GAM601 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM601 was detected is described hereinabove with reference to Figs. 2-8.

[8282] GAM601 gene, herein designated GAM GENE, and GAM601 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8283] GAM601 gene, herein designated GAM GENE, encodes a GAM601 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM601 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM601 precursor RNA is designated SEQ ID:578, and is provided hereinbelow with reference to the sequence listing part.

[8284] GAM601 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8285] An enzyme complex designated DICER COMPLEX, dices the GAM601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM601 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM601 RNA is designated SEQ ID:3178, and is provided hereinbelow with reference to the sequence listing part.

[8286] GAM601 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM601 target RNA, herein designated GAM TARGET RNA. GAM601 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8287] GAM601 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM601 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM601 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM601 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM601 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8288] The complementary binding of GAM601 RNA, herein designated GAM RNA, to target binding sites on GAM601 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM601 target RNA, herein designated GAM TARGET RNA, into GAM601 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8289] It is appreciated that GAM601 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM601 target genes. The mRNA of each one of this plurality of GAM601 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM601 RNA, herein designated GAM RNA, and which when bound by GAM601 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM601 target proteins.

[8290] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM601 gene, herein designated GAM GENE, on one or more GAM601 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8291] It is yet further appreciated that specific functions, and accordingly utilities, of GAM601 correlate with, and may be deduced from, the identity of the target genes which GAM601 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8292] Nucleotide sequences of the GAM601 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM601 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM601 are further described hereinbelow with reference to Table 1.

[8293] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM601 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8294] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 602 (GAM602) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8295] GAM602 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM602 was detected is described hereinabove with reference to Figs. 2-8.

[8296] GAM602 gene, herein designated GAM GENE, and GAM602 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8297] GAM602 gene, herein designated GAM GENE, encodes a GAM602 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM602 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM602 precursor RNA is designated SEQ ID:579, and is provided hereinbelow with reference to the sequence listing part.

[8298] GAM602 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM602 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8299] An enzyme complex designated DICER COMPLEX, dices the GAM602 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM602 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM602 RNA is designated SEQ ID:3179, and is provided hereinbelow with reference to the sequence listing part.

[8300] GAM602 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM602 target RNA, herein designated GAM TARGET RNA. GAM602 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8301] GAM602 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM602

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM602 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM602 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM602 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8302] The complementary binding of GAM602 RNA, herein designated GAM RNA, to target binding sites on GAM602 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM602 target RNA, herein designated GAM TARGET RNA, into GAM602 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8303] It is appreciated that GAM602 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM602 target genes. The mRNA of each one of this plurality of GAM602 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM602 RNA, herein designated GAM RNA, and which when bound by GAM602 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM602 target proteins.

[8304] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM602 gene, herein designated GAM GENE, on one or more GAM602 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8305] It is yet further appreciated that specific functions, and accordingly utilities, of GAM602 correlate with, and may be deduced from, the identity of the target genes which GAM602 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8306] Nucleotide sequences of the GAM602 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM602 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM602 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM602 are further described hereinbelow with

reference to Table 1.

[8307] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM602 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8308] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 603 (GAM603) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8309] GAM603 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM603 was detected is described hereinabove with reference to Figs. 2-8.

[8310] GAM603 gene, herein designated GAM GENE, and GAM603 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8311] GAM603 gene, herein designated GAM GENE, encodes a GAM603 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM603 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM603 precursor RNA is designated SEQ ID:580, and is provided

hereinbelow with reference to the sequence listing part.

[8312] GAM603 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM603 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8313] An enzyme complex designated DICER COMPLEX, dices the GAM603 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM603 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM603 RNA is designated SEQ ID:3180, and is provided hereinbelow with reference to the sequence listing part.

[8314] GAM603 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM603 target RNA, herein designated GAM TARGET RNA. GAM603 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[8315] GAM603 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM603 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM603 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM603 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM603 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8316] The complementary binding of GAM603 RNA, herein designated GAM RNA, to target binding sites on GAM603 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM603 target RNA, herein designated GAM TARGET RNA, into GAM603 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8317] It is appreciated that GAM603 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM603 target genes. The mRNA of each one of this plurality of GAM603 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM603 RNA, herein designated GAM RNA, and which when bound by GAM603 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM603 target proteins.

[8318] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM603 gene, herein designated GAM GENE, on one or more GAM603 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8319] It is yet further appreciated that specific functions, and accordingly utilities, of GAM603 correlate with, and may be deduced from, the identity of the target genes which GAM603 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8320] Nucleotide sequences of the GAM603 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM603 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM603 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM603 are further described hereinbelow with reference to Table 1.

[8321] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM603 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8322] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 604 (GAM604) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8323] GAM604 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM604 was detected is described hereinabove with reference to Figs. 2-8.

[8324] GAM604 gene, herein designated GAM GENE, and GAM604 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8325] GAM604 gene, herein designated GAM GENE, encodes a GAM604 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM604 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM604 precursor RNA is designated SEQ ID:581, and is provided hereinbelow with reference to the sequence listing part.

[8326] GAM604 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM604 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8327] An enzyme complex designated DICER COMPLEX, dices the GAM604 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM604 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM604 RNA is designated SEQ ID:3181, and is provided hereinbelow with reference to the sequence listing part.

[8328] GAM604 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM604 target RNA, herein designated

GAM TARGET RNA. GAM604 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8329] GAM604 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM604 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM604 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM604 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM604 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8330] The complementary binding of GAM604 RNA, herein designated GAM RNA, to target binding sites on GAM604 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM604 target RNA, herein designated GAM

TARGET RNA, into GAM604 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8331] It is appreciated that GAM604 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM604 target genes. The mRNA of each one of this plurality of GAM604 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM604 RNA, herein designated GAM RNA, and which when bound by GAM604 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM604 target proteins.

[8332] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM604 gene, herein designated GAM GENE, on one or more GAM604 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8333] It is yet further appreciated that specific functions, and accordingly utilities, of GAM604 correlate with, and may be deduced from, the identity of the target

genes which GAM604 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8334] Nucleotide sequences of the GAM604 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM604 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM604 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM604 are further described hereinbelow with reference to Table 1.

[8335] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM604 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8336] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 605 (GAM605) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8337] GAM605 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM605 was detected is described hereinabove with reference to Figs. 2-8.

[8338] GAM605 gene, herein designated GAM GENE, and GAM605 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[8339] GAM605 gene, herein designated GAM GENE, encodes a GAM605 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM605 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM605 precursor RNA is designated SEQ ID:582, and is provided hereinbelow with reference to the sequence listing part.

[8340] GAM605 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM605 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8341] An enzyme complex designated DICER COMPLEX, dices the GAM605 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM605 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM605 RNA is designated SEQ ID:3182, and is provided

hereinbelow with reference to the sequence listing part.

[8342] GAM605 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM605 target RNA, herein designated GAM TARGET RNA. GAM605 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8343] GAM605 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM605 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM605 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM605 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM605 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8344] The complementary binding of GAM605 RNA, herein designated GAM RNA, to target binding sites on GAM605 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM605 target RNA, herein designated GAM TARGET RNA, into GAM605 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8345] It is appreciated that GAM605 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM605 target genes. The mRNA of each one of this plurality of GAM605 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM605 RNA, herein designated GAM RNA, and which when bound by GAM605 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM605 target proteins.

[8346] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM605 gene, herein designated GAM GENE, on one or more GAM605 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8347] It is yet further appreciated that specific functions, and accordingly utilities, of GAM605 correlate with, and may be deduced from, the identity of the target genes which GAM605 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8348] Nucleotide sequences of the GAM605 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM605 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM605 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM605 are further described hereinbelow with reference to Table 1.

[8349] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM605 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8350] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 606 (GAM606) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8351] GAM606 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM606 was detected is

described hereinabove with reference to Figs. 2-8.

[8352] GAM606 gene, herein designated GAM GENE, and GAM606 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8353] GAM606 gene, herein designated GAM GENE, encodes a GAM606 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM606 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM606 precursor RNA is designated SEQ ID:583, and is provided hereinbelow with reference to the sequence listing part.

[8354] GAM606 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM606 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8355] An enzyme complex designated DICER COMPLEX, dices the GAM606 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM606 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM606 RNA is designated SEQ ID:3183, and is provided hereinbelow with reference to the sequence listing part.

[8356] GAM606 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM606 target RNA, herein designated GAM TARGET RNA. GAM606 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8357] GAM606 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM606 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM606 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM606 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM606 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8358] The complementary binding of GAM606 RNA, herein designated GAM RNA, to target binding sites on GAM606 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM606 target RNA, herein designated GAM TARGET RNA, into GAM606 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8359] It is appreciated that GAM606 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM606 target genes. The mRNA of each one of this plurality of GAM606 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM606 RNA, herein designated GAM RNA, and which when bound by GAM606 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM606 target proteins.

[8360] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM606 gene, herein designated GAM GENE, on one or more GAM606 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8361] It is yet further appreciated that specific functions, and accordingly utilities, of GAM606 correlate with, and may be deduced from, the identity of the target genes which GAM606 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8362] Nucleotide sequences of the GAM606 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM606 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM606 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM606 are further described hereinbelow with reference to Table 1.

[8363] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM606 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8364] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 607 (GAM607) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8365] GAM607 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM607 was detected is described hereinabove with reference to Figs. 2-8.

[8366] GAM607 gene, herein designated GAM GENE, and GAM607 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8367] GAM607 gene, herein designated GAM GENE, encodes a GAM607 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM607 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM607 precursor RNA is designated SEQ ID:584, and is provided hereinbelow with reference to the sequence listing part.

[8368] GAM607 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM607 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8369] An enzyme complex designated DICER COMPLEX, dices the GAM607 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM607 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM607 RNA is designated SEQ ID:3184, and is provided hereinbelow with reference to the sequence listing part.

[8370] GAM607 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM607 target RNA, herein designated GAM TARGET RNA. GAM607 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8371] GAM607 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM607 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM607 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM607 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM607 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8372] The complementary binding of GAM607 RNA, herein designated GAM RNA, to target binding sites on GAM607 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM607 target RNA, herein designated GAM TARGET RNA, into GAM607 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8373] It is appreciated that GAM607 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM607 target genes. The mRNA of each one of this plurality of GAM607 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM607 RNA, herein designated GAM RNA, and which when bound by GAM607 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM607 target proteins.

[8374] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM607 gene, herein designated GAM GENE, on one or more GAM607 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8375] It is yet further appreciated that specific functions, and accordingly utilities, of GAM607 correlate with, and may be deduced from, the identity of the target genes which GAM607 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8376] Nucleotide sequences of the GAM607 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM607 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM607 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM607 are further described hereinbelow with reference to Table 1.

[8377] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM607 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8378] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 608 (GAM608) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8379] GAM608 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM608 was detected is described hereinabove with reference to Figs. 2-8.

[8380] GAM608 gene, herein designated GAM GENE, and GAM608 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8381] GAM608 gene, herein designated GAM GENE, encodes a GAM608 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM608 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM608 precursor RNA is designated SEQ ID:585, and is provided hereinbelow with reference to the sequence listing part.

[8382] GAM608 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM608 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8383] An enzyme complex designated DICER COMPLEX, dices the GAM608 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM608 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM608 RNA is designated SEQ ID:3186, and is provided hereinbelow with reference to the sequence listing part.

[8384] GAM608 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM608 target RNA, herein designated GAM TARGET RNA. GAM608 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8385] GAM608 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM608 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM608 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM608 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM608 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8386] The complementary binding of GAM608 RNA, herein designated GAM RNA, to target binding sites on GAM608 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM608 target RNA, herein designated GAM TARGET RNA, into GAM608 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8387] It is appreciated that GAM608 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM608 target genes. The mRNA of each one of this plurality of GAM608 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM608 RNA, herein designated GAM RNA, and which when bound by GAM608 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM608 target proteins.

[8388] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM608 gene, herein designated GAM GENE, on one or more

GAM608 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8389] It is yet further appreciated that specific functions, and accordingly utilities, of GAM608 correlate with, and may be deduced from, the identity of the target genes which GAM608 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8390] Nucleotide sequences of the GAM608 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM608 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM608 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM608 are further described hereinbelow with reference to Table 1.

[8391] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM608 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8392] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 609 (GAM609) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8393] GAM609 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM609 was detected is described hereinabove with reference to Figs. 2-8.

[8394] GAM609 gene, herein designated GAM GENE, and GAM609 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8395] GAM609 gene, herein designated GAM GENE, encodes a GAM609 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM609 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM609 precursor RNA is designated SEQ ID:586, and is provided hereinbelow with reference to the sequence listing part.

[8396] GAM609 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM609 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8397] An enzyme complex designated DICER COMPLEX, dices the GAM609 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM609 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM609 RNA is designated SEQ ID:3185, and is provided hereinbelow with reference to the sequence listing part.

[8398] GAM609 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM609 target RNA, herein designated GAM TARGET RNA. GAM609 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8399] GAM609 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM609 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM609 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM609 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM609 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8400] The complementary binding of GAM609 RNA, herein designated GAM RNA, to target binding sites on GAM609 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM609 target RNA, herein designated GAM TARGET RNA, into GAM609 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8401] It is appreciated that GAM609 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM609 target genes. The mRNA of each one of this plurality of GAM609 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM609 RNA, herein designated GAM RNA, and which when bound by GAM609 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM609 target proteins.

[8402] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM609 gene, herein designated GAM GENE, on one or more GAM609 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8403] It is yet further appreciated that specific functions, and accordingly utilities, of GAM609 correlate with, and may be deduced from, the identity of the target genes which GAM609 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8404] Nucleotide sequences of the GAM609 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM609 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM609 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM609 are further described hereinbelow with reference to Table 1.

[8405] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM609 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8406] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 610 (GAM610) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8407] GAM610 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM610 was detected is described hereinabove with reference to Figs. 2-8.

[8408] GAM610 gene, herein designated GAM GENE, and GAM610 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8409] GAM610 gene, herein designated GAM GENE, encodes a GAM610 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM610 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM610 precursor RNA is designated SEQ ID:587, and is provided hereinbelow with reference to the sequence listing part.

[8410] GAM610 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM610 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8411] An enzyme complex designated DICER COMPLEX, dices the GAM610 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM610 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM610 RNA is designated SEQ ID:3188, and is provided hereinbelow with reference to the sequence listing part.

[8412] GAM610 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM610 target RNA, herein designated GAM TARGET RNA. GAM610 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8413] GAM610 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM610

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM610 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM610 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM610 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8414] The complementary binding of GAM610 RNA, herein designated GAM RNA, to target binding sites on GAM610 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM610 target RNA, herein designated GAM TARGET RNA, into GAM610 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8415] It is appreciated that GAM610 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM610 target genes. The mRNA of each one of this plurality of GAM610 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM610 RNA, herein designated GAM RNA, and which when bound by GAM610 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM610 target proteins.

[8416] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM610 gene, herein designated GAM GENE, on one or more GAM610 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8417] It is yet further appreciated that specific functions, and accordingly utilities, of GAM610 correlate with, and may be deduced from, the identity of the target genes which GAM610 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8418] Nucleotide sequences of the GAM610 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM610 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM610 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM610 are further described hereinbelow with

reference to Table 1.

[8419] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM610 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8420] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 611 (GAM611) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8421] GAM611 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM611 was detected is described hereinabove with reference to Figs. 2-8.

[8422] GAM611 gene, herein designated GAM GENE, and GAM611 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8423] GAM611 gene, herein designated GAM GENE, encodes a GAM611 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM611 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM611 precursor RNA is designated SEQ ID:588, and is provided

hereinbelow with reference to the sequence listing part.

[8424] GAM611 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM611 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8425] An enzyme complex designated DICER COMPLEX, dices the GAM611 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM611 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM611 RNA is designated SEQ ID:3187, and is provided hereinbelow with reference to the sequence listing part.

[8426] GAM611 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM611 target RNA, herein designated GAM TARGET RNA. GAM611 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[8427] GAM611 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM611 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM611 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM611 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM611 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8428] The complementary binding of GAM611 RNA, herein designated GAM RNA, to target binding sites on GAM611 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM611 target RNA, herein designated GAM TARGET RNA, into GAM611 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8429] It is appreciated that GAM611 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM611 target genes. The mRNA of each one of this plurality of GAM611 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM611 RNA, herein designated GAM RNA, and which when bound by GAM611 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM611 target proteins.

[8430] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM611 gene, herein designated GAM GENE, on one or more GAM611 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8431] It is yet further appreciated that specific functions, and accordingly utilities, of GAM611 correlate with, and may be deduced from, the identity of the target genes which GAM611 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8432] Nucleotide sequences of the GAM611 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM611 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM611 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM611 are further described hereinbelow with reference to Table 1.

[8433] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM611 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8434] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 612 (GAM612) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8435] GAM612 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM612 was detected is described hereinabove with reference to Figs. 2-8.

[8436] GAM612 gene, herein designated GAM GENE, and GAM612 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8437] GAM612 gene, herein designated GAM GENE, encodes a GAM612 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM612 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM612 precursor RNA is designated SEQ ID:589, and is provided hereinbelow with reference to the sequence listing part.

[8438] GAM612 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM612 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8439] An enzyme complex designated DICER COMPLEX, dices the GAM612 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM612 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM612 RNA is designated SEQ ID:3189, and is provided hereinbelow with reference to the sequence listing part.

[8440] GAM612 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM612 target RNA, herein designated

GAM TARGET RNA. GAM612 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8441] GAM612 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM612 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM612 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM612 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM612 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8442] The complementary binding of GAM612 RNA, herein designated GAM RNA, to target binding sites on GAM612 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM612 target RNA, herein designated GAM

TARGET RNA, into GAM612 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8443] It is appreciated that GAM612 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM612 target genes. The mRNA of each one of this plurality of GAM612 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM612 RNA, herein designated GAM RNA, and which when bound by GAM612 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM612 target proteins.

[8444] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM612 gene, herein designated GAM GENE, on one or more GAM612 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8445] It is yet further appreciated that specific functions, and accordingly utilities, of GAM612 correlate with, and may be deduced from, the identity of the target

genes which GAM612 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8446] Nucleotide sequences of the GAM612 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM612 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM612 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM612 are further described hereinbelow with reference to Table 1.

[8447] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM612 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8448] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 613 (GAM613) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8449] GAM613 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM613 was detected is described hereinabove with reference to Figs. 2-8.

[8450] GAM613 gene, herein designated GAM GENE, and GAM613 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[8451] GAM613 gene, herein designated GAM GENE, encodes a GAM613 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM613 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM613 precursor RNA is designated SEQ ID:590, and is provided hereinbelow with reference to the sequence listing part.

[8452] GAM613 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM613 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8453] An enzyme complex designated DICER COMPLEX, dices the GAM613 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM613 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM613 RNA is designated SEQ ID:3190, and is provided

hereinbelow with reference to the sequence listing part.

[8454] GAM613 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM613 target RNA, herein designated GAM TARGET RNA. GAM613 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8455] GAM613 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM613 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM613 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM613 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM613 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8456] The complementary binding of GAM613 RNA, herein designated GAM RNA, to target binding sites on GAM613 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM613 target RNA, herein designated GAM TARGET RNA, into GAM613 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8457] It is appreciated that GAM613 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM613 target genes. The mRNA of each one of this plurality of GAM613 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM613 RNA, herein designated GAM RNA, and which when bound by GAM613 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM613 target proteins.

[8458] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM613 gene, herein designated GAM GENE, on one or more GAM613 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8459] It is yet further appreciated that specific functions, and accordingly utilities, of GAM613 correlate with, and may be deduced from, the identity of the target genes which GAM613 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8460] Nucleotide sequences of the GAM613 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM613 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM613 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM613 are further described hereinbelow with reference to Table 1.

[8461] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM613 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8462] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 614 (GAM614) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8463] GAM614 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM614 was detected is

described hereinabove with reference to Figs. 2-8.

[8464] GAM614 gene, herein designated GAM GENE, and GAM614 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8465] GAM614 gene, herein designated GAM GENE, encodes a GAM614 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM614 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM614 precursor RNA is designated SEQ ID:591, and is provided hereinbelow with reference to the sequence listing part.

[8466] GAM614 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM614 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8467] An enzyme complex designated DICER COMPLEX, dices the GAM614 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM614 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM614 RNA is designated SEQ ID:3191, and is provided hereinbelow with reference to the sequence listing part.

[8468] GAM614 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM614 target RNA, herein designated GAM TARGET RNA. GAM614 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8469] GAM614 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM614 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM614 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM614 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM614 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8470] The complementary binding of GAM614 RNA, herein designated GAM RNA, to target binding sites on GAM614 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM614 target RNA, herein designated GAM TARGET RNA, into GAM614 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8471] It is appreciated that GAM614 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM614 target genes. The mRNA of each one of this plurality of GAM614 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM614 RNA, herein designated GAM RNA, and which when bound by GAM614 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM614 target proteins.

[8472] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM614 gene, herein designated GAM GENE, on one or more GAM614 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8473] It is yet further appreciated that specific functions, and accordingly utilities, of GAM614 correlate with, and may be deduced from, the identity of the target genes which GAM614 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8474] Nucleotide sequences of the GAM614 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM614 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM614 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM614 are further described hereinbelow with reference to Table 1.

[8475] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM614 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8476] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 615 (GAM615) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8477] GAM615 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM615 was detected is described hereinabove with reference to Figs. 2-8.

[8478] GAM615 gene, herein designated GAM GENE, and GAM615 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8479] GAM615 gene, herein designated GAM GENE, encodes a GAM615 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM615 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM615 precursor RNA is designated SEQ ID:592, and is provided hereinbelow with reference to the sequence listing part.

[8480] GAM615 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM615 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8481] An enzyme complex designated DICER COMPLEX, dices the GAM615 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM615 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM615 RNA is designated SEQ ID:3192, and is provided hereinbelow with reference to the sequence listing part.

[8482] GAM615 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM615 target RNA, herein designated GAM TARGET RNA. GAM615 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8483] GAM615 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM615 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM615 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM615 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM615 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8484] The complementary binding of GAM615 RNA, herein designated GAM RNA, to target binding sites on GAM615 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM615 target RNA, herein designated GAM TARGET RNA, into GAM615 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8485] It is appreciated that GAM615 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM615 target genes. The mRNA of each one of this plurality of GAM615 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM615 RNA, herein designated GAM RNA, and which when bound by GAM615 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM615 target proteins.

[8486] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM615 gene, herein designated GAM GENE, on one or more GAM615 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8487] It is yet further appreciated that specific functions, and accordingly utilities, of GAM615 correlate with, and may be deduced from, the identity of the target genes which GAM615 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8488] Nucleotide sequences of the GAM615 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM615 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM615 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM615 are further described hereinbelow with reference to Table 1.

[8489] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM615 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8490] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 616 (GAM616) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8491] GAM616 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM616 was detected is described hereinabove with reference to Figs. 2-8.

[8492] GAM616 gene, herein designated GAM GENE, and GAM616 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8493] GAM616 gene, herein designated GAM GENE, encodes a GAM616 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM616 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM616 precursor RNA is designated SEQ ID:593, and is provided hereinbelow with reference to the sequence listing part.

[8494] GAM616 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM616 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8495] An enzyme complex designated DICER COMPLEX, dices the GAM616 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM616 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM616 RNA is designated SEQ ID:3193, and is provided hereinbelow with reference to the sequence listing part.

[8496] GAM616 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM616 target RNA, herein designated GAM TARGET RNA. GAM616 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8497] GAM616 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM616 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM616 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM616 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM616 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8498] The complementary binding of GAM616 RNA, herein designated GAM RNA, to target binding sites on GAM616 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM616 target RNA, herein designated GAM TARGET RNA, into GAM616 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8499] It is appreciated that GAM616 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM616 target genes. The mRNA of each one of this plurality of GAM616 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM616 RNA, herein designated GAM RNA, and which when bound by GAM616 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM616 target proteins.

[8500] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM616 gene, herein designated GAM GENE, on one or more

GAM616 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8501] It is yet further appreciated that specific functions, and accordingly utilities, of GAM616 correlate with, and may be deduced from, the identity of the target genes which GAM616 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8502] Nucleotide sequences of the GAM616 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM616 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM616 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM616 are further described hereinbelow with reference to Table 1.

[8503] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM616 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8504] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 617 (GAM617) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8505] GAM617 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM617 was detected is described hereinabove with reference to Figs. 2-8.

[8506] GAM617 gene, herein designated GAM GENE, and GAM617 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8507] GAM617 gene, herein designated GAM GENE, encodes a GAM617 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM617 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM617 precursor RNA is designated SEQ ID:594, and is provided hereinbelow with reference to the sequence listing part.

[8508] GAM617 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8509] An enzyme complex designated DICER COMPLEX, dices the GAM617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM617 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM617 RNA is designated SEQ ID:3194, and is provided hereinbelow with reference to the sequence listing part.

[8510] GAM617 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM617 target RNA, herein designated GAM TARGET RNA. GAM617 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8511] GAM617 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM617 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM617 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM617 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM617 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8512] The complementary binding of GAM617 RNA, herein designated GAM RNA, to target binding sites on GAM617 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM617 target RNA, herein designated GAM TARGET RNA, into GAM617 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8513] It is appreciated that GAM617 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM617 target genes. The mRNA of each one of this plurality of GAM617 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM617 RNA, herein designated GAM RNA, and which when bound by GAM617 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM617 target proteins.

[8514] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM617 gene, herein designated GAM GENE, on one or more GAM617 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8515] It is yet further appreciated that specific functions, and accordingly utilities, of GAM617 correlate with, and may be deduced from, the identity of the target genes which GAM617 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8516] Nucleotide sequences of the GAM617 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM617 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM617 are further described hereinbelow with reference to Table 1.

[8517] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM617 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8518] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 618 (GAM618) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8519] GAM618 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM618 was detected is described hereinabove with reference to Figs. 2-8.

[8520] GAM618 gene, herein designated GAM GENE, and GAM618 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8521] GAM618 gene, herein designated GAM GENE, encodes a GAM618 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM618 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM618 precursor RNA is designated SEQ ID:595, and is provided hereinbelow with reference to the sequence listing part.

[8522] GAM618 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM618 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8523] An enzyme complex designated DICER COMPLEX, dices the GAM618 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM618 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM618 RNA is designated SEQ ID:3195, and is provided hereinbelow with reference to the sequence listing part.

[8524] GAM618 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM618 target RNA, herein designated GAM TARGET RNA. GAM618 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8525] GAM618 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM618

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM618 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM618 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM618 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8526] The complementary binding of GAM618 RNA, herein designated GAM RNA, to target binding sites on GAM618 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM618 target RNA, herein designated GAM TARGET RNA, into GAM618 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8527] It is appreciated that GAM618 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM618 target genes. The mRNA of each one of this plurality of GAM618 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM618 RNA, herein designated GAM RNA, and which when bound by GAM618 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM618 target proteins.

[8528] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM618 gene, herein designated GAM GENE, on one or more GAM618 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8529] It is yet further appreciated that specific functions, and accordingly utilities, of GAM618 correlate with, and may be deduced from, the identity of the target genes which GAM618 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8530] Nucleotide sequences of the GAM618 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM618 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM618 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM618 are further described hereinbelow with

reference to Table 1.

[8531] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM618 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8532] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 619 (GAM619) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8533] GAM619 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM619 was detected is described hereinabove with reference to Figs. 2-8.

[8534] GAM619 gene, herein designated GAM GENE, and GAM619 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8535] GAM619 gene, herein designated GAM GENE, encodes a GAM619 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM619 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM619 precursor RNA is designated SEQ ID:596, and is provided

hereinbelow with reference to the sequence listing part.

[8536] GAM619 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM619 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8537] An enzyme complex designated DICER COMPLEX, dices the GAM619 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM619 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM619 RNA is designated SEQ ID:3196, and is provided hereinbelow with reference to the sequence listing part.

[8538] GAM619 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM619 target RNA, herein designated GAM TARGET RNA. GAM619 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[8539] GAM619 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM619 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM619 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM619 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM619 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8540] The complementary binding of GAM619 RNA, herein designated GAM RNA, to target binding sites on GAM619 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM619 target RNA, herein designated GAM TARGET RNA, into GAM619 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8541] It is appreciated that GAM619 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM619 target genes. The mRNA of each one of this plurality of GAM619 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM619 RNA, herein designated GAM RNA, and which when bound by GAM619 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM619 target proteins.

[8542] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM619 gene, herein designated GAM GENE, on one or more GAM619 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8543] It is yet further appreciated that specific functions, and accordingly utilities, of GAM619 correlate with, and may be deduced from, the identity of the target genes which GAM619 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8544] Nucleotide sequences of the GAM619 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM619 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM619 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM619 are further described hereinbelow with reference to Table 1.

[8545] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM619 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8546] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 620 (GAM620) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8547] GAM620 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM620 was detected is described hereinabove with reference to Figs. 2-8.

[8548] GAM620 gene, herein designated GAM GENE, and GAM620 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8549] GAM620 gene, herein designated GAM GENE, encodes a GAM620 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM620 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM620 precursor RNA is designated SEQ ID:597, and is provided hereinbelow with reference to the sequence listing part.

[8550] GAM620 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM620 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8551] An enzyme complex designated DICER COMPLEX, dices the GAM620 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM620 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM620 RNA is designated SEQ ID:3197, and is provided hereinbelow with reference to the sequence listing part.

[8552] GAM620 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM620 target RNA, herein designated

GAM TARGET RNA. GAM620 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8553] GAM620 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM620 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM620 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM620 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM620 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8554] The complementary binding of GAM620 RNA, herein designated GAM RNA, to target binding sites on GAM620 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM620 target RNA, herein designated GAM

TARGET RNA, into GAM620 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8555] It is appreciated that GAM620 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM620 target genes. The mRNA of each one of this plurality of GAM620 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM620 RNA, herein designated GAM RNA, and which when bound by GAM620 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM620 target proteins.

[8556] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM620 gene, herein designated GAM GENE, on one or more GAM620 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8557] It is yet further appreciated that specific functions, and accordingly utilities, of GAM620 correlate with, and may be deduced from, the identity of the target

genes which GAM620 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8558] Nucleotide sequences of the GAM620 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM620 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM620 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM620 are further described hereinbelow with reference to Table 1.
